

Statistical Signal Processing**2015/2016**

Code: 42845

ECTS Credits: 6

Degree	Type	Year	Semester
4313797 Telecommunication Engineering	OB	1	1

Contact

Name: Jose Antonio Lopez Salcedo

Email: Jose.Salcedo@uab.cat

Use of languages

Principal working language: english (eng)

Teachers

Javier Serrano García

Marco Antonio Bara Iniesta

Rafael Gallego Terris

Prerequisites

For students who have been admitted indirectly to the master (e.g. those who must attend complementary courses), they should have already passed the course on "Tractament digital del senyal" (TDS) offered within the B.Sc. degree on Telecommunication Systems Engineering (i.e. "Grau d'Enginyeria en Sistemes de Telecomunicació").

Objectives and Contextualisation

The goal of this course is to introduce advanced techniques in statistical signal processing with applications in the domain of telecommunication systems.

Skills

- Capacity for applying theory of information methods, adaptative modulation and channel coding as well as advanced techniques for digital signal processing in telecommunications and audiovisual systems.
- Capacity for critical reasoning and thought as means for originality in the generation, development and/or application of ideas in a research or professional context.
- Capacity for designing radionavigation, positioning systems and radar systems.
- Capacity to integrate new technologies and systems developed within telecommunications engineering in general and in broader, multidisciplinary contexts such as bioengineering, photovoltaic conversion, nanotechnology, telemedicine
- Possess and understand knowledge that provides a basis or opportunity for originality in the development and/or application of ideas, often in a research context
- Student should possess the learning skills that enable them to continue studying in a way that is largely student led or independent
- Students should know how to apply the knowledge they have acquired and their capacity for problem solving in new or little known fields within wider (or multidisciplinary) contexts related to the area of study
- Students should know how to communicate their conclusions, knowledge and final reasoning that they hold in front of specialist and non-specialist audiences clearly and unambiguously

Learning outcomes

1. Analyse the implications at system level of the use of statistical signal processing techniques.
2. Apply advanced mathematical methods for the resolution of problems related to statistical signal processing.
3. Capacity for critical reasoning and thought as means for originality in the generation, development and/or application of ideas in a research or professional context.
4. Develop and evaluate signal detection techniques with applications in positioning and radar systems.
5. Develop statistical filtering systems aimed at synchronisation, equalisation and detection in communications receivers
6. Make a statistical classification of signals and random processes of telecommunications systems.
7. Possess and understand knowledge that provides a basis or opportunity for originality in the development and/or application of ideas, often in a research context
8. Student should possess the learning skills that enable them to continue studying in a way that is largely student led or independent
9. Students should know how to apply the knowledge they have acquired and their capacity for problem solving in new or little known fields within wider (or multidisciplinary) contexts related to the area of study
10. Students should know how to communicate their conclusions, knowledge and final reasoning that they hold in front of specialist and non-specialist audiences clearly and unambiguously

Content

Part I. Detection theory

- Detection of completely characterized signals.
- Detection of partially characterized signals.

Part II. Bayesian filtering theory

- Fundamentals of Bayesian estimation.
- Kalman filtering.

Part III. Digital speech processing

Part IV. Digital SAR image processing

Methodology

Activities at class:

- Theoretical classes: development of the theoretical contents of this course.
- Exercises solved by the instructor with participation of the students.
- Written evaluation tests.

Student self-learning activities:

- Study of the theoretical and practical contents of this course.
- Preparation of exercises and other homework.
- Preparation of the evaluation tests.

Activities

Title	Hours	ECTS	Learning outcomes
Type: Directed			

Theoretical lectures	39	1.56	1, 2, 3, 6, 4, 5, 9, 10, 8, 7
Type: Supervised			
Appointments	13	0.52	9, 10
Type: Autonomous			
Study	90	3.6	1, 2, 3, 6, 4, 5, 8

Evaluation

The marks of the exams will be averaged leading to the following course mark:

CourseMark = (mark Exam1 + mark Exam2 + mark Exam3 + mark Exam4) / 4.

The course will be declared to be passed when CourseMark \geq 5.

If CourseMark < 5, students will have a second chance to pass the course by doing a final exam covering all or just those parts of the syllabus that have been failed.

Students missing all four exams will be declared to be "absent" in the final mark of this course.

Evaluation activities

Title	Weighting	Hours	ECTS	Learning outcomes
Exam 1 (corresponding to part I of the syllabus)	25%	2	0.08	1, 2, 6, 4, 8, 7
Exam 2 (corresponding to part II of the syllabus)	25%	2	0.08	1, 2, 3, 6, 5, 10, 8
Exam 3 (corresponding to part III of the syllabus)	25%	2	0.08	1, 3, 6, 9, 10, 8, 7
Exam 4 (corresponding to part IV of the syllabus)	25%	2	0.08	1, 2, 3, 6, 4, 9, 10, 8, 7
