

**Plant Molecular Biology and Plant Genetic Engineering**

Code: 43864  
ECTS Credits: 6

Degree	Type	Year	Semester
4316231 Plant Biology, Genomics and Biotechnology	OB	0	1

## Contact

Name: Maria Carme Espunya Prat  
Email: Carme.Espunya@uab.cat

## Use of languages

Principal working language: english (eng)

## Teachers

David Caparros Ruíz

## Prerequisites

Although there are no official prerequisites for studying this module, it is recommended to have previously acquired basic knowledge in Biochemistry, Molecular Biology and Genetics, preferably in the area of plants.

## Objectives and Contextualisation

The overall objective of this module is to train specialists with solid and updated skills in Biology and Plant Biotechnology, to be competent in the knowledge of relevant aspects of plant molecular biology and Genetic Engineering, and their application in research, encouraging at the same time an active participation of the students and their critical spirit.

The specific objectives of the module are:

- To understand and to be able to identify the main characteristics of the plants which are applied in plant molecular genetic studies.
- To understand the main characteristics of plant gene structure and expression.
- To describe the techniques of manipulation and production of genetically modified plants.
- To understand the process of genetic transformation of plants and the related concepts of cisgenesis and transgenesis.
- To understand and to be capable of using tools for the study of the genome, proteome, transcriptome and metabolome.
- To integrate the acquired knowledge to solve practical subjects on the context of a laboratory of Molecular Biology and Genetic Engineering

## Skills

- Analyze research results to obtain new products or processes, evaluating their industrial and commercial viability for transfer to society.
- Apply knowledge of plant molecular genetics in different scientific and industrial areas.
- Communicate and justify conclusions clearly and unambiguously to both specialised and non-specialised audiences.
- Explain the processes of obtaining genetically modified plants and their use.
- Identify and explain social and ethical responsibility in the obtainment and use of genetically-modified plants and recognise the relevant legal aspects of this.
- Identify and use Bio-Computer Science tools to be applied to the genetic, evolutionary and functional study of plants.
- Solve problems in new or little-known situations within broader (or multidisciplinary) contexts related to the field of study.
- Synthesize, and analyze alternatives and debate critically.
- Use and manage bibliographical information and computer resources in the area of study.
- Work in a multidisciplinary team.

## Learning outcomes

1. Analyze research results to obtain new products or processes, evaluating their industrial and commercial viability for transfer to society.
2. Communicate and advise efficiently in the interpretation of data obtained from specific bioinformatic databases and tools for plants.
3. Communicate and justify conclusions clearly and unambiguously to both specialised and non-specialised audiences.
4. Communicate the characteristics of genetically-modified plants efficiently.
5. Design transgenic plants and adapt the transformation processes to the needs arising during professional development.
6. "Process ""omic"" plant data using bioinformatic tools."
7. Propose bioinformatic solutions to problems deriving from research into the molecular biology of plants.
8. Propose, improve and defend research projects based on new technologies.
9. Propose innovative entrepreneurial solutions in plant genetic engineering.
10. Solve problems in new or little-known situations within broader (or multidisciplinary) contexts related to the field of study.
11. Synthesize, and analyze alternatives and debate critically.
12. Use and manage bibliographical information and computer resources in the area of study.
13. Use legal regulations in research with transgenic plants.
14. Work in a multidisciplinary team.

## Content

- Item 1. Plants as a model in research on Molecular Genetics.
- Item 2. Structure and expression of plant genes. Regulation of gene transfer to plant genomes.
- Item 3. Obtaining genetically modified plants. Concepts of cisgenesis versus transgenesis. Methods of plant transformation: Agrobacterium infection, biolistics, insertion of transgenes into chloroplast. Stable transformation and transient transformation. Transformation of monocotyledonous plants.
- Item 4. Regeneration and selection of transgenic plants. Selection markers: resistance to antibiotics, herbicides and metabolic markers. Elimination of the transgene from the plant genome. Regulation of the expression of the transgene: constitutive, specific and inducible promoters.
- Item 5. Detection of transgenes in plant organisms and in raw food materials. Relevant legislation. Features of the main GM crops.
- Item 6. Use of bioinformatic tools for the collection and processing data in omics research in the context of Plant Molecular Biology and Genetic Engineering.

## Methodology

Training activities include the following elements:

- Lectures. Classroom lectures developing the theoretical contents will be performed. Graphic material (class presentations) will be available to students through the Virtual Campus tool. Additionally, students will have to search bibliographic information about the contents presented in order to supplement their training.
- Solving practical cases. Study cases drawn from recent research articles will be analyzed in detail, working hypothesis will be formulated, how these hypothesis have been addressed, achievements and possible shortcomings, future work, etc.. The aim of this activity is to promote through a proactive attitude, the participation and critical thinking of students, at both individual and teamwork levels.
- Bioinformatics sessions in which practical cases will present in order to get training in the used of the main bioinformatics tools applied to the area of the plants. This activity will take place in the computer rooms of the Faculty of Biosciences on schedule, although significant independent work will be required.
- Preparation and presentation of a portfolio/seminar by each student in relation to module contents. This activity will require a preliminary discussion with the tutor of the project to determine the main points, followed by a bibliographic search related to the topic. The seminar will include hypothesis, objectives and methodology. An oral presentation, using graphic material and computer facilities, in front of the instructor and the students will be performed, followed by a debate where suggestions, questions and doubts will be formulated in order to enrich the overall activity.
- Autonomous activities include autonomous comprehension and study of the module contents, bibliography research and preparation of a portfolio/seminar.

## Activities

Title	Hours	ECTS	Learning outcomes
<b>Type: Directed</b>			
Bioinformatics sessions in computer room	6	0.24	2, 6, 7
Debate portfolio/seminar	5	0.2	11
Lectures/expositive class	12	0.48	5, 9, 10
Solving practical cases	7	0.28	1, 7, 9, 10, 11, 12, 14
<b>Type: Supervised</b>			
Personal and grupal tutorship	10	0.4	1, 2, 7, 9, 11
Presentation of a portfolio/seminar	6	0.24	3, 4, 8, 11, 14
<b>Type: Autonomous</b>			
Autonomous study	40	1.6	1, 5, 7, 9, 10, 11
Preparation of a portfolio/seminar	20	0.8	5, 8, 10, 12, 13, 14
Search and read related bibliography	30	1.2	11, 12

## Evaluation

The assessment of this module will take the form of continuous assessment in order to encourage the efforts of the student throughout the module, allowing to monitor their level of understanding and integration of content.

The evaluation activities are:

- Lectures, through a written exam of the contents covered in the lectures of theory.
- Portfolio/Seminar, which assess both the scientific content and the quality of the exhibition, and the defense and answer of the questions posed by the teacher and other students.
- Solving practical cases from scientific articles and bioinformatics data. This activity will require considerable autonomous preparation work, as classroom exercises will be proposed, corrected and evaluated.
- Proactive attitude, class participation, scientific rigor of contributions, etc. These items will be assessed continuously throughout the module.

Compulsory attendance of at least 80% of classroom activities is required for the evaluation of the module. It is necessary to obtain a final 5 or higher to pass the module.

## Evaluation activities

Title	Weighting	Hours	ECTS	Learning outcomes
Preparation of portfolio/seminar/practical cases	20%	5	0.2	1, 6, 7, 9, 10, 12, 13, 14
Presentation defense and debate of a portfolio/seminar/practical cases	25%	2	0.08	2, 3, 4, 8, 11
Proactive attitude, class participation, scientific rigor in contributions, etc	20%	5	0.2	1, 2, 3, 4, 8, 14
Written exam of lecture contents	35%	2	0.08	4, 5, 9, 10

## Bibliography
