GLOBAL APPROXIMATION BY MODIFIED BASKAKOV TYPE OPERATORS

Vijay Gupta

Abstract

In the present paper, we prove a global direct theorem for the modified Baskakov type operators in terms of so called Ditzian-Totik modulus of smoothness.

1. Introduction

Motivated by the integral modification of Bernstein polynomials by Durrmeyer [3], Sahai and Prasad [6] first defined and studied modified Baskakov operators. Sinha et al. [7] improved and corrected the results of [6]. Recently the author [4], introduced another modification of Baskakov operators by taking the weight function of Beta operators on \( L_1[0, \infty) \) as

\[
(B_n f)(x) = \sum_{k=0}^{\infty} p_{n,k}(x) \int_0^{\infty} b_{n,k}(t) f(t) \, dt, \quad x \in [0, \infty)
\]

where

\[
p_{n,k}(x) = \binom{n+k-1}{k} x^k (1+x)^{-n-k}
\]

and

\[
b_{n,k}(t) = [B(k+1,n)]^{-1} t^k (1+t)^{-n-k-1},
\]

\( B(k+1,n) \) being the Beta function given by \( k!(n-1)!/(n+k)! \).

In [4], the author has obtained only local direct theorems in simultaneous approximation, as the operators defined by (1.1) give better approximation than the earlier integral modification of Baskakov operators.

Research supported by Council of Scientific and Industrial Research, India under award no. 9/143(163)/91-EMR-1.
studied in [5], [6] and [7] etc., this motivated us to extend the results of [4] to the whole interval [0, ∞) and we study a global result for the operators (1.1).

By \( L^r_1[0, \infty) \), we denote the class of functions \( g \) given by

\[
L^r_1[0, \infty) := \{ g : g^{(r)} \in L_1[0, a] \text{ for every } a \in (0, \infty) \text{ and } |g^{(r)}(t)| \leq M(1 + t)^m, M \text{ and } m \text{ are constants depending on } g \}.
\]

We may remark that \( L^r_1[0, \infty) \) is not contained in \( L^r_1[0, \infty) \).

Following [2], the modulus of smoothness of \( f \) is given by

\[
\omega^2_\phi(f, t)_p = \sup_{0 < h \leq t} \| \Delta^2_h f \|_p, \phi(x) = \sqrt{x(1 + x)}
\]

where

\[
\Delta^2_h f(x) = \begin{cases} 
  f(x - h) - 2f(x) + f(x + h), & \text{if } [x - h, x + h] \subset [0, \infty) \\
  0, & \text{otherwise.}
\end{cases}
\]

This modulus of smoothness is equivalent to the modified \( k \)-functional (see e.g. [2]) given by

\[
\bar{K}^2_\phi(f, t^2)_p = \inf \{ \| f - g \|_p + t^2 \| \phi^2 g'' \|_p + t^4 \| g''' \|_p; g \in \bar{W}^2_\phi(\phi, [0, \infty)) \}
\]

where

\[
\bar{W}^2_\phi(\phi, [0, \infty)) = \{ g \in L_p[0, \infty) : g' \in AC_{\text{loc}}[0, \infty); \phi^2 g'' \in L_p[0, \infty)) \}.
\]

In [4] the author was not able to obtain global results. In the present paper, we prove a global direct theorem in simultaneous approximation for the operators \((B_n f)(x)\) defined by (1.1) in terms of Ditzian-Totik modulus of second order.

Throughout the paper we denote by \( C \) the positive constants not necessarily the same at each occurrence.

### 2. Auxiliary results

In this section, we shall give certain definitions and lemmas which will be used in the sequel.

For every \( n \in \mathbb{N} \) and \( n > (r + 1) \) we have

\[
(2.1) \quad \sum_{k=0}^{\infty} p_{n,k}(x) = 1, \quad \int_0^\infty b_{n,k}(t) \, dt = 1
\]

\[
\int_0^\infty \frac{t}{n} b_{n,k}(t) \, dt = \frac{k + r + 1}{n - r - 1}
\]
Lemma 2.1 [4]. Let $m$, $r \in \mathbb{N}_0$, we define

$$T_{r,n,m}(x) = \sum_{k=0}^{\infty} p_{n+r,k}(x) \int_0^{\infty} b_{n-r,k+r}(t)(t-x)^m \, dt$$

then

$$T_{r,n,0}(x) = 1, \quad T_{r,n,1}(x) = \frac{1 + r + x(1 + 2r)}{(n - r - 1)},$$
$$T_{r,n,2}(x) = \frac{2(2r^2 + 4r + n + 1)x^2 + 2(2r^2 + 5r + 2 + n)x + (r^2 + 3r + 2)}{(n - r - 1)(n - r - 2)},$$

and there holds the recurrence relation:

$$(n - m - r - 1)T_{r,n,m+1}(x) = \phi^2(x)\left[T_{r,n,m}(x) + 2mT_{r,n,m-1}(x)\right]$$

$$+ ([m + r + 1](1 + 2x) - x]T_{r,n,m}(x), \quad n > m + r + 1.$$ 

Consequently for each $x \in [0, \infty)$, $T_{r,n,m}(x) = 0(n^{-\lceil(m+1)/2\rceil})$, $[\alpha]$ denotes the integral part of $\alpha$.

The proof of this lemma easily follows along the lines of [6], [7] using

$$\phi^2(x)p'_{n,k}(x) = (k - nx)p_{n,k}(x) \quad \text{and} \quad \phi^2(t)b'_{n,k}(t) = [k - (n + 1)\ell]b_{n,k}(t).$$

From the above lemma, we have

$$T_{r,n,2m}(x) = \sum_{i=0}^{m} q_{i,m,n}(x) \left[\frac{\phi^2(x)}{n}\right]^{m-i} n^{-2i}$$

$$T_{r,n,2m+1}(x) = (1 + 2x) \sum_{i=0}^{m} s_{i,m,n}(x) \left[\frac{\phi^2(x)}{n}\right]^{m-i} n^{-2i-1},$$

where $q_{i,m,n}(x)$ and $s_{i,m,n}(x)$ are polynomials in $x$ of fixed degree with coefficients that are bounded uniformly for all $n$.

**Lemma 2.2.** If $f \in L_p^r[0, \infty) \cup L_1^r[0, \infty)$, $1 \leq p \leq \infty$, $n > r(1 + m)$ and $x \in [0, \infty)$, then

$$\left(B_n f^{(r)}(x) = \alpha(n, r) \sum_{k=0}^{\infty} p_{n+r,k}(x) \int_0^{\infty} b_{n-r,k+r}(t)f^{(r)}(t) \, dt\right)$$
where
\[ \alpha(n,r) = \frac{(n+r-1)!(n-r-1)!}{((n-1)!)^2} = \prod_{\ell=0}^{r-1} \frac{n+\ell}{n-(\ell+1)}. \]

Proof: By using Leibnitz theorem, we have

\[
(B_n f)^{(r)}(x) = \sum_{i=0}^{r} \sum_{k=0}^{\infty} \binom{r}{i} \frac{(n+k+r-i-1)!}{(n-1)!(k-i)!} \times (-1)^{r-i} x^{k-i} (1+x)^{n-k-r+i} \times \int_0^{\infty} b_{n,k}(t) f(t) dt \]
\[
= \frac{(n+r-1)!}{(n-1)!} \sum_{k=0}^{\infty} p_{n+r,k}(x) \times \int_0^{\infty} \sum_{i=0}^{r} (-1)^{r-i} \binom{r}{i} b_{n,k+i}(t) f(t) dt. \]

Again, by the use of Leibnitz theorem, we have

\[
b_{n-r,k+r}^{(r)}(t) = \frac{(n-1)!}{(n-r-1)!} \sum_{i=0}^{r} (-1)^{i} \binom{r}{i} b_{n,k+i}(t). \]

Hence,

\[
(B_n f)^{(r)}(x) = \frac{(n+r-1)!(n-r-1)!}{((n-1)!)^2} \sum_{k=0}^{\infty} p_{n+r,k}(x) \int_0^{\infty} (-1)^{r} b_{n-r,k+r}^{(r)}(t) f(t) dt. \]

On integrating \( r \) times by parts, we get the required result.

We see that the operators defined in (2.3) by \( B_n^{(r)} f := (B_n f)^{(r)}, f \in L_p[0, \infty) \cup L_1[0, \infty) \) are not positive. To make the operators positive we introduce the operator

\[ B_{n,r} f \equiv D^r B_n I^r f, \quad f \in L_p[0, \infty) \cup L_1[0, \infty), \]

where \( D \) and \( I \) are differentiation and integration operators respectively. Therefore we define the operator by

\[
(B_{n,r} f)(x) = \alpha(n,r) \sum_{k=0}^{\infty} p_{n+r,k}(x) \int_0^{\infty} b_{n-r,k+r}(t) f(t) dt, \]
$f \in L_p[0, \infty) \cup L_1[0, \infty)$, $n > r(1 + m)$.

The operators $B_{n,r}$ are positive and the estimation $\| (B_n f)^{(r)} - f^{(r)} \|_p$, $f \in L_p^r[0, \infty)$ is equivalent to $\| B_{n,r} f - f \|_p$, $f \in L_p[0, \infty)$.

Using (2.1), we can easily prove that for $n > (r + 1)$, $\| B_{n,r} f \|_1 \leq C \| f \|_1$, for $f \in L_1[0, \infty)$ and $\| B_{n,r} f \| \leq C \| f \|_\infty$ for $f \in L_\infty[0, \infty)$. Making use of Riesz-Thorin theorem, we get

$$\tag{2.4} \| B_{n,r} f \|_p \leq C \| f \|_p, f \in L_p[0, \infty), 1 \leq p \leq \infty, n > (r + 1).$$

**Corollary 2.3.** For every $m \in \mathbb{N}_0$, $n > (r + 2m + 1)$ and $x \in [0, \infty)$ we have

$$\tag{2.5} |B_{n,r}( (t - x)^{2m}, x) | \leq C n^{-m} (\phi(x) + n^{-1})^m,$$

$$|B_{n,r}( (t - x)^{2m+1}, x) | \leq C (1 + 2x) n^{-m} (\phi(x) + n^{-1})^m$$

where the constant $C$ is independent of $n$. For fixed $x \in [0, \infty)$ we obtain

$$\tag{2.6} |B_{n,r}( (t - x)^m, x) | = 0 (n^{-[(m+1)/2]}), \quad n \to \infty.$$

**Proof:** Since $B_{n,r}( (t - x)^m, x) = \alpha(n, r) T_{r,n,m}(x)$ the estimate (2.5) follows from (2.2) along the lines of [5], (2.6) immediately follows from (2.5). ■

**Lemma 2.4.** Let $t \in [0, \infty)$ and $n > (r + m)$ then

$$B_{n,r}( (1 + t)^{-m}, x) \leq C (1 + x)^{-m}, \quad x \in [0, \infty)$$

where the constant $C$ is independent of $n$.

**Proof:** It is easily verified that

$$(1 + t)^{-m} b_{n-r,k+r}(t) = \prod_{\ell=0}^{m-1} \frac{n - r + \ell}{n + \ell + k + 1} b_{n-r+m,k+r}(t)$$

and

$$p_{n+r,k}(x) = (1 + x)^{-m} \prod_{\ell=1}^{m} \frac{n + r - \ell + k}{n + r - \ell - p_{n+r-m,k}(x)}.$$
Making use of these two identities and (2.1) we get

\[ B_{n,r}((1 + t)^{-m}, x) = \alpha(n, r) \sum_{k=0}^{\infty} p_{n+r,k}(x) \int_{0}^{\infty} b_{n-r,k+r}(t)(1 + t)^{-m} dt \]

\[ = \alpha(n, r) \sum_{k=0}^{\infty} p_{n+r,k}(x) \prod_{\ell=0}^{m-1} \frac{n - r + \ell}{n + \ell + k + 1} \]

\[ \times \int_{0}^{\infty} b_{n-r+m,k+r}(t) dt \]

\[ = \alpha(n, r) \sum_{k=0}^{\infty} (1+x)^{-m} p_{n+r-k,m}(x) \frac{n + r - \ell}{n + \ell + k + 1} \]

\[ \times \prod_{\ell=0}^{m-1} \frac{n + r - \ell}{n + \ell + k + 1} \]

\[ \leq C(1 + x)^{-m} \sum_{k=0}^{\infty} p_{n+r-m,k}(x) \]

\[ = C(1 + x)^{-m}. \]

For the two monomials \( e_0, e_1 \) and \( x \in [0, \infty) \), \( n \to \infty \) we obtain by direct computation

\( (2.7) \quad B_{n,r}(e_0, x) = 1 + 0(n^{-1}) \)

\( (2.8) \quad B_{n,r}(e_1, x) = x(1 + 0(n^{-1})). \)

**Lemma 2.5.** For \( H_n(u) \) given by

\[ H_n(u) = \left\{ \int_{0}^{\infty} \int_{0}^{u} \int_{0}^{\infty} \sum_{k=0}^{\infty} p_{n+r,k}(x) b_{n-r,k+r}(t)(u-t) dt dx \right\} \]

we have \( H_n(u) \leq Cn^{-1} \phi^2(u) \), where \( C \) is independent of \( n \) and \( u \).

The proof of the above lemma easily follows by using (2.1) along the lines of [1, Lemma 5.2].

3. Direct result

**Theorem 3.1.** Suppose \( f \in L_p[0, \infty) \), \( 1 \leq p < \infty \), \( n > (r+5) \) then we have

\[ \|B_{n,r}f - f\|_p \leq C\{\omega_2^2(f, n^{-1/2}) + n^{-1}\|f\|_p\} \]
where the constant $C$ is independent of $n$.

Proof: By Taylor's expansion of $g$, we have

\begin{equation}
(3.1) \quad g(t) = g(x) + (t - x)g'(x) + \int_x^t (t - u)g''(u) \, du.
\end{equation}

Next, since $B_{n,r}(f,x)$ are uniformly bounded operators so for every $g \in W^2_p(\phi, [0, \infty))$, we have

\begin{equation}
\|B_{n,r} f - f\|_p \leq C\|f - g\|_p + \|B_{n,r} g - g\|_p.
\end{equation}

Using (2.5), (2.8) and (3.1) and following [2], we obtain

\begin{equation}
\|B_{n,r} g - g\|_p \leq C\|g\|_p + \|g'\|_{L^p[0,1]} + \|B_{n,r}(R(g,t,x),x)\|_p
\end{equation}

where $R(g,t,x) = \int_t^x (t - u)g''(u) \, du$.

Now, we shall prove that

\begin{equation}
\|B_{n,r}(R(g,t,x),x)\|_p \leq Cn^{-1}\|\phi^2 + n^{-1}\|g''\|_p.
\end{equation}

We prove this for $p = 1$ and $p = \infty$. The cases $1 < p < \infty$ follows again by Riesz-Thorin theorem.

Using (2.5) for the case $m = 1$ and Lemma 2.4, the case $p = \infty$ easily follows (see e.g. [5]).

For $p = 1$, we derive (3.4) by applying Fubini’s theorem twice, the definition of $H_n(u)$ and Lemma 2.5 as

\begin{equation}
\int_0^\infty |B_{n,r}(R(g,t,x),x)| \, dx
\leq \alpha(n,r) \int_0^\infty \sum_{k=0}^\infty \int_0^\infty \int_0^\infty b_{n-r,k+r}(t) \int_t^x (t - u)g''(u) \, dt \, dx
\end{equation}

\begin{equation}
= \alpha(n,r) \int_0^\infty |g''(u)| \left\{ \int_0^\infty \int_0^u - \int_0^u \int_0^\infty \right\} (u - t)
\times \sum_{k=0}^\infty p_{n+r,k}(x) b_{n-r,k+r}(t) \, dt \, dx \, du
\end{equation}

\begin{equation}
= \alpha(n,r) \int_0^\infty |g''(u)| H_n(u) \, du
\leq Cn^{-1}\|\phi^2 g''\|_1
\leq Cn^{-1}\|\phi^2 + n^{-1}\|g''\|_1,
\end{equation}
where $C$ is independent of $n$. Hence (3.4) holds by Riesz-Thorin theorem for $1 \leq p \leq \infty$. Combining the estimates of (3.2), (3.3) and (3.4) we get

$$
\| B_{n,r}f - f \|_p = C\|f - g\|_p + Cn^{-1}\{\|f - g\|_p + \|f\|_p + \|\phi^2 g''\|_p
$$
$$
+ \|\phi^2 + n^{-1})g''\|_p\}
$$
$$
\leq C\{\|f - g\|_p + n^{-1}\|\phi^2 g''\|_p + n^{-2}\|g''\|_p + n^{-1}\|f\|_p\}.
$$

Next taking the infimum over all $g \in \hat{W}_p^2(\phi, [0,\infty))$ on the right hand side, we get

$$
\|B_{n,r}f - f\|_p \leq C\{\hat{K}_n^2(f, n^{-1}) + n^{-1}\|f\|_p\},
$$

this completes the proof of Theorem 3.1.

**Remark.** The conclusion of Theorem 3.1 is true on the space $L_p[0,\infty)$, $1 \leq p < \infty$ (i.e. $\lim_{n \to \infty} \|B_{n,r}f - f\|_p = 0$ for every $f \in L_p[0,\infty)$), since the most basic fact about $\omega_2^2(f, n^{-1})$ is that

$$
\lim_{n \to \infty} \omega_2^2(f, n^{-1}) = 0 \text{ for all } f \in L_p[0,\infty), \quad 1 \leq p < \infty,
$$

or for all bounded functions $f \in C[0,\infty)$ which satisfy

$$
\lim_{x \to \infty} f(x) = L_\infty < \infty, \quad \text{if } p = \infty \quad \text{(cf. [2, p. 36])}.
$$
