### SUMMARY

The haematological parameters of healthy great bustards (*Otis tarda* L.) have been determined. The values obtained were red cell count ( $3.0 \times 10^{12} \pm 0.2 \times 10^{12}/l$ ), white cell count ( $33.0 \times 10^9 \pm 2.6 \times 10^9/l$ ), haematocrit value ( $0.51 \pm 0.01 l/l$ ), haemoglobin ( $13.0 \pm 0.3 g/dl$ ), mean corpuscular volume ( $178.7 \pm 12.5 fl$ ), mean cell haemoglobin concentration ( $25.0 \pm 0.6 g/dl$ ), mean corpuscular haemoglobin ( $42.5 \pm 3.2 pg$ ), differential white cell count: heterophils ( $22.5 \times 10^9 \pm 0.7 \times 10^9/l$ ), lymphocytes ( $6.0 \times 10^9 \pm 0.7 \times 10^9/l$ ), eosinophils ( $2.7 \times 10^9 \pm 0.3 \times 10^9/l$ ) and monocytes ( $1.8 \times 10^9 \pm 0.2 \times 10^9/l$ ).

### INTRODUCTION

The great bustard is an endangered species in Europe. Therefore, all the efforts aimed at the protection of this species must be supported.

In the past few years, we have seen an increase in the numbers of these birds taken to the Clinic of Internal Medicine due to pathological problems. For this reason we have studied the haemophysiological parameters, with the purpose of establishing reference values.

### MATERIALS AND METHODS

Thirty-six clinically healthy birds were chosen at random without chemical immobilization, from the Las Seguras. The birds were between 1 and 11 years of age. The animals have been kept on a 124-acre farm. We cannot accept, therefore, that they were in absolute captivity. The birds were fed on insects and other casual seasonal food.

Heparinized blood (5 ml samples) obtained by venipuncture from the ulnaris vein, was analysed as follows: erythrocyte and leucocyte counts (Natt & Herrick, 1952), using Neubauer's haemocytometer; haemoglobin, using a spectrophotometrical modification to the acid haematin technique; mean corpuscular haemoglobin (MCH); mean corpuscular volume (MCV); mean corpuscular haemoglobin concentration (MCHC); haematocrit (after centrifugation at 9072 g); differential leucocyte count, from thin blood film was stained with Diff-Quick's fast colouring technique (Dade Grifols-Laboratories).

**Table 1.** Mean values ( $\pm$  SEM) (grand, male and female) corresponding to the different parameters of the red series

	Grand	Males	Females
RBC ( $\times 10^{12}/l$ )	3.0 $\pm$ 0.2	3.7 $\pm$ 0.4	2.8 $\pm$ 0.2
Hb (g/dl)	13.0 $\pm$ 0.3	13.9 $\pm$ 0.6	12.6 $\pm$ 0.5
Haematocrit (l/l)	0.51 $\pm$ 0.01	0.5 $\pm$ 2.3	0.5 $\pm$ 1.3
MCV (fl)	178.7 $\pm$ 12.5	123.3 $\pm$ 6.6	201.7 $\pm$ 22.1
MCHC (g/dl)	25.0 $\pm$ 0.6	27.2 $\pm$ 0.8	24.0 $\pm$ 0.1
MCH (pg)	42.5 $\pm$ 3.2	31.9 $\pm$ 1.5	47.0 $\pm$ 6.1

**Table 2.** Mean values ( $\pm$  SEM) (grand, male and female) corresponding to the different parameters of the white series

	Grand	Males	Females
WBC ( $\times 10^9/l$ )	33.0 $\pm$ 2.6	32.3 $\pm$ 4.0	30.5 $\pm$ 3.4
Heterophils ( $\times 10^9/l$ )	22.5 $\pm$ 0.7	20.8 $\pm$ 1.2	21.0 $\pm$ 0.8
Lymphocytes ( $\times 10^9/l$ )	6.0 $\pm$ 0.7	6.7 $\pm$ 1.5	5.8 $\pm$ 0.8
Eosinophils ( $\times 10^9/l$ )	2.7 $\pm$ 0.3	2.6 $\pm$ 0.8	2.4 $\pm$ 0.3
Monocytes ( $\times 10^9/l$ )	1.8 $\pm$ 0.2	2.2 $\pm$ 0.1	1.3 $\pm$ 0.2

## RESULTS AND DISCUSSION

The data obtained were subjected to a simple analysis of variance carried out to determine the effect of sex. The results are given in Tables 1 and 2.

No protozoa or microfilariae were seen in blood smears. The mean number of erythrocytes differed between males and females ( $P < 0.005$ ). Similar differences have been described by Hunsaker *et al.* (1964) for the goose (*Anser anser*), Sturkie (1967) for the chicken (*Gallus domesticus*) and Nirmalan & Robinson (1971) for the quail (*Coturnix coturnix*). The mean value of  $3.0 \times 10^{12}$  RBC/l is the same as the one obtained by Balasch *et al.* (1974) for different avian species.

The haemoglobin values for the species were 13.0 g/dl, similar to those obtained by other authors (Balasch *et al.*, 1973, 1974, 1976) for birds such as the brown pelican (*Pelicanus occidentalis occidentalis*), imperial eagle (*Aquila heliaca*) or Andean condor (*Vultur gryphus*). However, the observed mean haemoglobin value was larger than that found by Alonso *et al.* (1990) in free-living young great bustards, 11.7 g/dl. This may reflect the differences in age. Adult birds usually have higher values as demonstrated by Tanaka & Rosenberg (1954) and Deaton *et al.* (1969) in the chicken (*Gallus domesticus*), by Hunsaker *et al.* (1964) in the goose (*Anser anser*) and by Atwal *et al.* (1964) in the quail (*Coturnix coturnix*).

The haematocrit value for great bustards, 0.51 l/l, is greater than that reported by Alonso *et al.* (1990) of 41% in free-living young great bustards. The mean MCV value obtained in our experiment, at 178.7 fl, is somewhat larger than that reported by Alonso *et al.* (1990) in free-living young great bustards (166.6 fl), and very much higher than that quoted for the domestic fowl (*Gallus domesticus*) by other authors (Abou-Ashour &

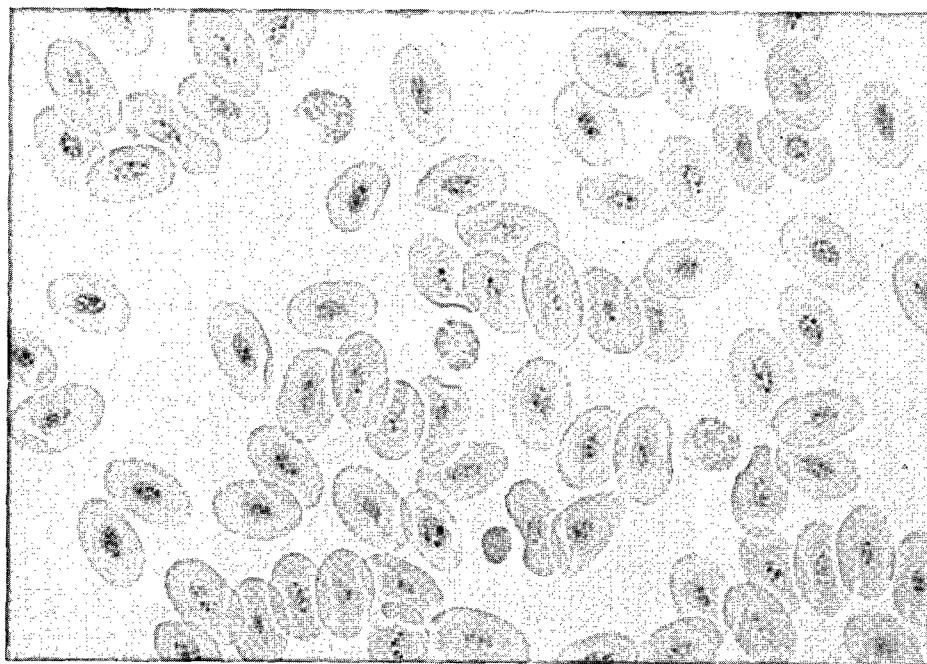

Figure 1. Three lymphocytes in a bustard blood smear.

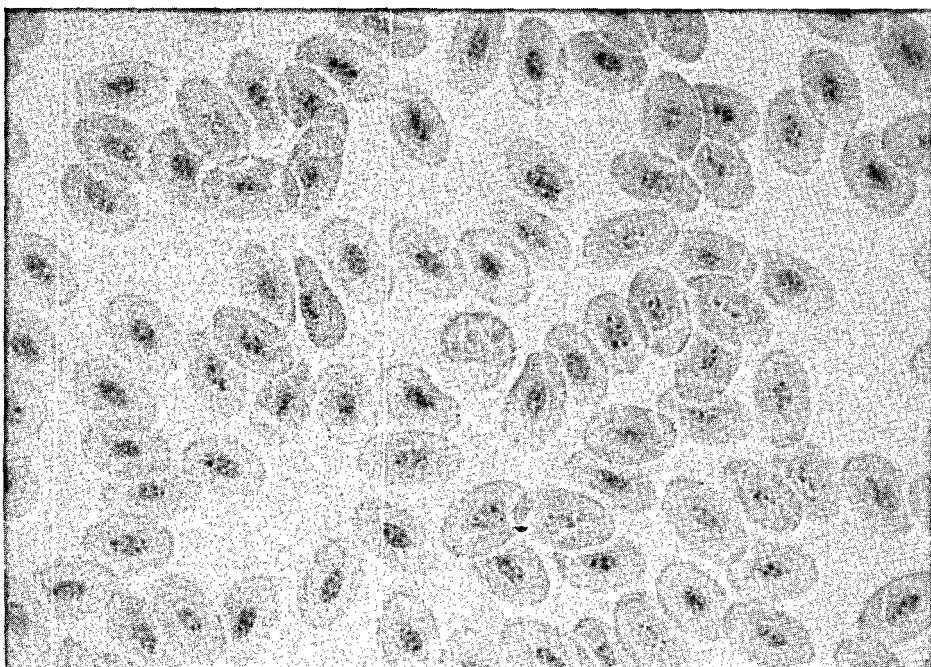

Figure 3. A monocyte from a bustard.

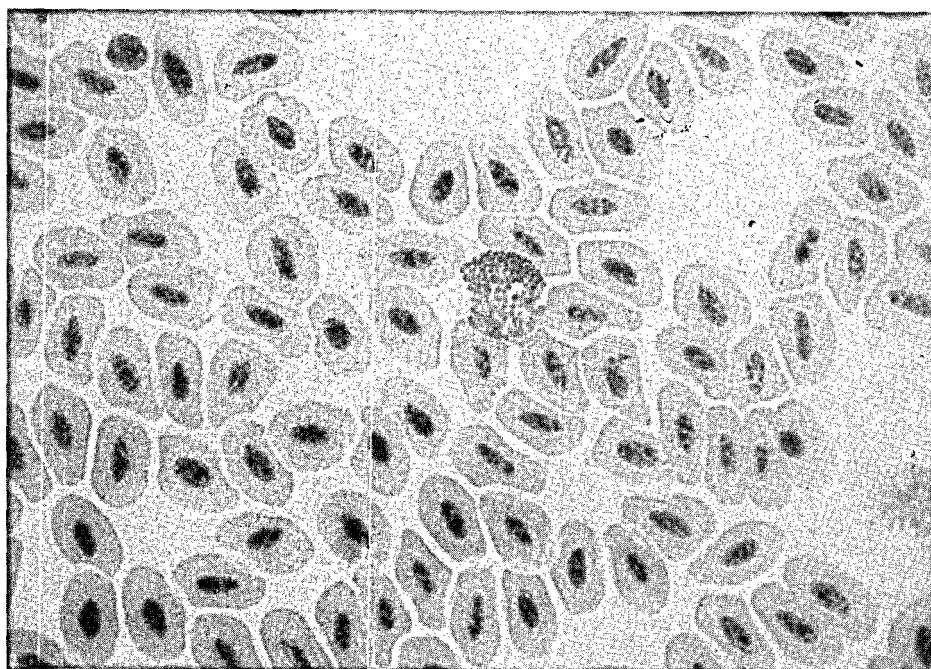

Figure 4. An eosinophil in a bustard blood film.

Edwards, 1972). In contrast the mean MCMH value of 25.0 g/dl, was less than that observed by Alonso *et al.* (1990) of 28.5 g/100 ml and considerably smaller than the mean value found by Jones & Johansen (1972) in several avian species such as domestic chicks (*Gallus domesticus*), wild ducks (*Anas platyrhynchos*) and wild turkeys (*Meleagris gallopavo*). This difference might be due, in part, to different centrifugational forms being employed in different studies.

The leucocytes values observed (Table 2) are similar to those obtained by Lucas & Jamroz (1961) for domestic chicks (*Gallus domesticus*) and by Venkataratnam & Clarkson (1962) for the peacock (*Pavo cristatus*). Nevertheless, the value of WBC count is much larger than that found by Alonso *et al.* (1990) in free-living young great bustards (11,000 WBC/mm<sup>3</sup>). This difference may be due to the fact that Alonso *et al.* (1990) examined young birds in their experiment, while all birds in this paper were adults.

The differential count of leucocytes in most birds, usually shows a higher percentage of lymphocytes (Figure 1). In great bustards, heterophils (Figure 2) are the predominant leucocytes, as in the case with the wild turkey (*Meleagris gallopavo*), the ring-necked pheasant (*Phasianus colchicus*), and the ostrich (*Struthio camelus*) (Fredrickson *et al.*, 1956; Schalm, 1981), with granules and colourless cytoplasm (Figure 2). The numbers of monocytes (Figure 3), and eosinophils (Figure 4), are comparable with those found in other birds (Sturkie, 1967).

## RESUME

### **Hematologie clinique de L'outarde (*otis tarda* L.)**

Dans ce travail on analysé plusieurs des paramètres hématiques des outardes (*Otis tarda* L.). Les valeurs obtenues sont les suivantes dénombrement total d'hématies ( $3.0 \times 10^{12} \pm 0.2 \times 10^{12}/l$ ), dénombrement total de leucocytes ( $33.0 \times 10^9 \pm 2.6 \times 10^9/l$ ), valeur hématocrite ( $0.51 \pm 0.01 1/l$ ), concentration d'hémoglobine ( $13.0 \pm 0.3 \text{ g/dl}$ ), volume corpusculaire moyen ( $178.7 \pm 12.5 \text{ fl}$ ), concentration corpusculaire moyenne d'hémoglobine ( $25.0 \pm 0.6 \text{ g/dl}$ ), hémoglobine corpusculaire moyenne ( $42.5 \pm 3.2 \text{ pg}$ ) et formule leucocytaire hétérophyles ( $22.5 \times 10^9 \pm 0.7 \times 10^9/l$ ), lymphocytes ( $6.0 \times 10^9 \pm 0.7 \times 10^9/l$ ), eosinophiles ( $2.7 \times 10^9 \pm 0.3 \times 10^9/l$ ) et monocytes ( $1.8 \times 10^9 \pm 0.2 \times 10^9/l$ ).

## ZUSAMMENFASSUNG

### **Klinische Hämatologie der Großtrappe (*otis tarda* L.)**

Bei dieser Arbeit wurden verschiedene Blutparameter der Trappen (*Otis tarda* L.) analysiert. Es wurden folgende Werte errechnet.

Gesamtazählung der roten Blutkörperchen ( $3.0 \times 10^{12} \pm 0.2 \times 10^{12}/l$ ), Zählung der weißen Blutkörperchen ( $33.0 \times 10^9 \pm 2.6 \times 10^9/l$ ), hämatokritischer Wert ( $0.51 \pm 0.01 1/l$ ), Hamoglobinkonzentration ( $13.0 \pm 0.3 \text{ g/dl}$ ), mittleres KörperfchengröÙe ( $178.7 \pm 12.5 \text{ fl}$ ), mittlere Körperchenmenge des Hämoglobin ( $25.0 \pm 0.6 \text{ g/dl}$ ), mittleres Körperchenhämoglobin ( $42.5 \pm 3.2 \text{ pg}$ ) sowie prozentuale Komposition der weißen Blutkörperchen: Heterophile ( $22.5 \times 10^9 \pm 0.7 \times 10^9/l$ ), Lymphozyte ( $6.0 \times 10^9 \pm 0.7 \times 10^9/l$ ), Eosinophile ( $2.7 \times 10^9 \pm 0.3 \times 10^9/l$ ), Monozyte ( $1.8 \times 10^9 \pm 0.2 \times 10^9/l$ ).

## RESUMEN

### **Hematología clínica de la avutarda (*otis tarda* L.)**

En este trabajo se han analizado varios parámetros hemáticos de las avutardas (*Otis tarda* L.). Los valores obtenidos son los siguientes: recuento total de hemáticas ( $3.0 \times 10^{12} \pm 0.2 \times 10^{12}/l$ ), recuento de glóbulos blancos ( $33.0 \times 10^9 \pm 2.6 \times 10^9/l$ ), valor hematocrito ( $0.51 \pm 0.01 1/l$ ), concentración de hemoglobina ( $13.0 \pm 0.3 \text{ g/dl}$ ), volumen corpuscular medio ( $178.7 \pm 12.5 \text{ fl}$ ), concentración corpuscular media de hemoglobina ( $25.0 \pm 0.6 \text{ g/dl}$ ), hemoglobina corpuscular media ( $42.5 \pm 3.2 \text{ pg}$ ) y fórmula leucocitaria: heterófilos ( $22.5 \times 10^9 \pm 0.7 \times 10^9/l$ ), infocitos ( $6.0 \times 10^9 \pm 0.7 \times 10^9/l$ ), eosinófilos ( $2.7 \times 10^9 \pm 0.3 \times 10^9/l$ ) y monocitos ( $1.8 \times 10^9 \pm 0.2 \times 10^9/l$ ).
