**Abstract:** In this study, we focus on invariant algebraic curves of generalized Liénard polynomial differential systems  $x' = y, y' = -f_m(x)y - g_n(x)$ , where the degrees of the polynomials  $f$  and  $g$  are  $m$  and  $n$ , respectively, and we correct some results previously stated.

**Keywords:** Liénard differential systems; invariant algebraic curve; first integrals

**MSC:** Primary 34A05; Secondary 34C05; 37C10

## 1. Introduction and Statement of the Main Results

In this work, we study the generalized Liénard polynomial differential systems of the following form:

$$x' = y, \quad y' = -f_m(x)y - g_n(x), \quad (1)$$

where the degrees of the polynomials  $f$  and  $g$  are given by the subscripts  $m$  and  $n$ , respectively. These generalized Liénard systems are used to model different problems in numerous areas of knowledge and have been intensively studied in the last decades (see for instance [1,2] and references therein).

Consider  $F(x, y) = 0$  an *invariant algebraic curve* of the differential system (1) where  $F(x, y)$  is a polynomial, then there exists a polynomial  $K(x, y)$  such that the following is the case.

$$\frac{\partial F}{\partial x}y + \frac{\partial F}{\partial y}(-f_m(x)y - g_n(x)) = KF \quad (2)$$

The knowledge of the algebraic curves of system (1) allows studying modern Darboux and Liouvillian theories of integrability (see [3] and references therein). In fact the existence of invariant algebraic curves is a measure of integrability in such theories. Another problem is finding a bound on the degree of irreducible invariant algebraic curves of system (1). This problem goes back to Poincaré for any differential system and is known as *Poincaré problem*.

In 1996, Hayashi [4] stated the following result.

**Theorem 1.** *The generalized Liénard polynomial differential system (1) with  $f_m \not\equiv 0$  and  $m + 1 \geq n$  has an invariant algebraic curve if and only if there is an invariant curve  $y - P(x) = 0$  satisfying  $g_n(x) = -(f_m(x) + P'(x))P(x)$ , where  $P(x)$  or  $P(x) + F(x)$  is a polynomial with a degree of at most one, such that  $F(x) = \int_0^x f(s)ds$ .*

Given  $P$  and  $Q$  polynomials, an algebraic curve of the form  $(y + P(x))^2 - Q(x) = 0$  is called *hyperelliptic curve* (see for instance [5–8]). In such works, hyperelliptic curves are used to determine the algebraic limit cycles of generalized Liénard systems (1).

Theorem 1 is also announced in [9], where the author seems to not be aware that the theorem is false. Theorem 1 is not correct as the following proposition shows. More

precisely, it shows the existence of hyperelliptic invariant algebraic curves for generalized Liénard systems (1).

**Proposition 1.** Under the assumptions of Theorem 1, the generalized Liénard polynomial differential system (1) has the following hyperelliptic invariant algebraic curves:

- (a)  $F(x, y) = -(b + ax)\lambda + (y - b - ax)^2 = 0$  for  $f_0(x) = -3a/2$  and  $g_1(x) = a(b + ax - \lambda)/2$  with  $a \neq 0$ ;
- (b)  $F(x, y) = -Ax^2 + (y - ax)^2$  for  $f_0(x) = -2a$  and  $g_1(x) = (a^2 - A)x$  with  $aA \neq 0$ ;
- (c)  $F(x, y) = -bc/(2a) - cx - acx^2/(2b) + (b + ax - y)^2 = 0$  for  $f_0(x) = -2a$  and  $g_1(x) = (2ab - c)(b + ax)/(2b)$  with  $ab \neq 0$ .

Proposition 1 is proved in Section 2.

In fact, the correct statement of Theorem 1 is the following.

**Theorem 2.** The generalized Liénard polynomial differential system (1) with  $f_m \neq 0$  and  $m + 1 \geq n$  has the invariant algebraic curve  $y - P(x) = 0$  if  $g_n(x) = -(f_m(x) + P'(x))P(x)$ , being  $P(x)$  or  $P(x) + F(x)$  a polynomial of degree at most one, where  $F(x) = \int_0^x f(s)ds$ .

Theorem 2 is proved in Section 2.

Note that the mistake in the statement of Theorem 1 is the claim that unique invariant algebraic curves are of the following form  $y - P(x) = 0$ .

Demina in [10] also detected that Theorem 1 was not correct. She found counterexamples to Theorem 1 with invariant algebraic curves of degree 2 and 3 in the variable  $y$ .

Singer in [11] found the characterization of systems that are Liouvillian integrable. Christopher [12] rewrote this result stating that if a polynomial differential system in  $\mathbb{R}^2$  has an inverse integrating factor of the following form:

$$V = \exp\left(\frac{D}{E}\right) \prod_{i=1}^p F_i^{\alpha_i}, \tag{3}$$

where  $D, E$  and  $F_i$  are polynomials in  $\mathbb{C}[x, y]$  and  $\alpha_i \in \mathbb{C}$ , then this differential system is Liouvillian integrable. For a definition of (inverse) integrating factor, see for instance Section 8.3 of [3].

We say that  $\exp(g/h)$ , with  $g$  and  $h \in \mathbb{C}[x, y]$ , is an exponential factor of the polynomial differential system (1) if there exists a polynomial  $L(x, y)$  of a degree with at most  $d$  where  $d = \max\{m, n - 1\}$  such that the following is the case.

$$\frac{\partial \exp(g/h)}{\partial x} y + \frac{\partial \exp(g/h)}{\partial y} (-f_m(x)y - g_n(x)) = K \exp(g/h).$$

More information on exponential factors can be found in Section 8.5 of [3].

The existence of an inverse integrating factor (3) for a polynomial differential system in  $\mathbb{R}^2$  is equivalent to the existence of  $\lambda_i$  and  $\mu_i \in \mathbb{C}$  is not all zero such that  $\sum_{i=1}^p \lambda_i K_i + \sum_{j=1}^q \mu_j L_j = \text{div}(P, Q)$ , where  $K_i$  and  $L_j$  are the cofactors of some invariant algebraic curves and exponential factors of the given polynomial differential system, respectively. See, for more details, statement (iv) of Theorem 8.7 of [3].

We remark that the two kinds of invariant algebraic curves mentioned in Theorem 2 can appear simultaneously in some generalized Liénard polynomial differential systems (1) as the following example shows, which already appeared in [13].

The generalized polynomial Liénard differential system of the following:

$$x' = y, \quad y' = -ex^3 - e^2/3x - (3x^2 + 4e/3)y, \tag{4}$$

has invariant algebraic curves  $f_1 = y + ex/3 = 0$  and  $f_2 = y + x^3 + ex/3 = 0$ . Moreover, system (4) is Liouvillian integrable because it has an inverse integrating factor  $V = f_1 f_2^{1/3}$ .

Let  $U$  be an open subset of  $\mathbb{R}^2$ . A  $C^1$  function  $H : U \rightarrow \mathbb{R}$  is a *first integral* of system (1) if it is constant on the orbits of the system contained in  $U$ , or equivalently if the following is the case.

$$\frac{dH}{dt} = \frac{\partial H}{\partial x}y + \frac{\partial H}{\partial y}(-f_m(x)y - g_n(x)) = 0 \text{ on } U. \tag{5}$$

Consider  $W$  as an open subset of  $\mathbb{R}^2 \times \mathbb{R}$ . A  $C^1$  function  $I : W \rightarrow \mathbb{R}$  is a *Darboux invariant* of system (1) if it is constant on the orbits of the system contained in  $W$ , or equivalently if the following is the case.

$$\frac{dI}{dt} + \frac{\partial I}{\partial x}y + \frac{\partial I}{\partial y}(-f_m(x)y - g_n(x)) = 0 \text{ on } W. \tag{6}$$

Moreover, given  $\lambda_i$  and  $\mu_j \in \mathbb{C}$  that is not all zero such that  $\sum_{i=1}^p \lambda_i K_i + \sum_{j=1}^q \mu_j L_j = -s$  for some  $s \in \mathbb{C} \setminus \{0\}$ , then the (multivalued) function of the following:

$$I = \prod_{i=1}^p F_i^{\alpha_i} \prod_{j=1}^q \left( \exp\left(\frac{g_j}{h_j}\right) \right)^{\mu_j} \exp(st) \tag{7}$$

is a *Darboux invariant* of the differential system (see for more details statement (vi) of Theorem 8.7 of [3]).

Under the assumptions of Theorem 2, there are generalized Liénard polynomial differential systems (1) that are Liouvillian integrable, as it is shown in the next result.

**Proposition 2.** *Under the assumptions of Theorem 2, if the generalized Liénard polynomial differential system (1) has an invariant algebraic curve  $y - P(x) = 0$ , then the following statements hold:*

- (a) *If  $P(x) = -F(x) + ax + b$ , then system (1) has the Darboux invariant  $(y - P(x))e^{at}$ ;*
- (b) *If  $P(x) = b$ , then system (1) is Liouvillian integrable with the first integral  $H = e^{y+F(x)}(y - b)^b$  if  $b \neq 0$ , and the first integral  $H = y + F(x)$  if  $b = 0$ .*

Proposition 2 is proved in Section 2.

We note that Proposition 2 shows that Theorem 2 of [13] and Theorem 4 of [14] are not correct because their proofs are based on the incorrect Theorem 1.

**Proposition 3.** *Consider the generalized Liénard polynomial differential system (1). Let  $P(x)$  be a polynomial, then  $y - P(x) = 0$  is an invariant algebraic curve of system (1) if and only if  $g_n(x) = -(f_m(x) + P'(x))P(x)$ .*

Proposition 3 is proved in Section 2. In fact, the statement of Proposition 3 already appears in [8] without proof.

Note that, in Proposition 3, there are no restrictions on the degrees of the polynomials  $f_m, g_n$  and  $P(x)$ .

The Liouvillian integrability of the generalized Liénard polynomial differential system has been studied by several authors. The main result of [15] is that under restriction  $2 \leq n \leq m$ , system (1) has a Liouvillian first integral if and only if  $g_n(x) = af_m(x)$ , where  $a \in \mathbb{C}$  (see also [16] for a shorter proof). Later on, the Liouvillian integrability of differential systems (1) having hyperelliptic curves of the form  $(y + Q(x)P(x))^2 - Q(x)^2 = 0$  was studied (see [17]).

In summary, the Liouvillian integrability in the case where  $n > m$  is still open. In fact, the characterization of the invariant algebraic curves of system (1) for this case is not complete. Recently, cases  $m = 1$  and  $n = 2$  have been solved (see [18]).

Case  $n = m + 1$  is the still the objective of several recent works. Thus, for instance in [10,19], some particular cases for  $m = 2$  and  $n = 3$  have been solved.

**2. Proofs**

**Proof of Proposition 1.** Assume that system (1) has an hyperelliptic invariant curve  $F = (y + P(x))^2 - Q(x) = 0$ . Then, from (2), denoting by  $K = K(x, y)$  the cofactor of  $F = 0$ , we obtain the following.

$$\begin{aligned} & 2g_n(x)P(x) + K(-P(x)^2 + Q(x)) \\ & + y(-2g_n(x) + 2P(x)(K + f_m(x) + P'(x)) - Q'(x)) \\ & - y^2(K + 2f_m(x) + 2P'(x)) = 0. \end{aligned}$$

From this equality, we observe that  $K = K(x) = -2(f_m(x) + P'(x))$ :

$$f_m(x) = -P'(x) - \frac{P(x)Q'(x)}{2Q(x)}, \text{ and } g_n(x) = -\frac{1}{2}Q'(x) + \frac{P^2(x)Q'(x)}{2Q(x)},$$

where  $f_m(x)$  and  $g_n(x)$  must be polynomials.

If we assume that  $\deg P = p$  and  $\deg Q = q$ , we obtain  $\deg f_m = p - 1$  and  $\deg g_n = \max\{q - 1, p^2 - 1\}$ . Since  $m + 1 \geq n$ , we obtain  $p \geq \max\{q - 1, p^2 - 1\}$ , which implies  $p = 1$ . Consequently,  $1 \geq q - 1$ , which implies  $q = 1, 2$ .

If  $q = 1$ , then  $P(x) = ax + b$  with  $a \neq 0$  and  $Q(x)$  must be proportional to  $P(x)$ ; that is,  $Q(x) = \lambda P(x)$ . Thus,  $f_m = -3a/2$  and  $g_n = a(ax + b - \lambda)/2$ , and  $F = (b + ax - y)^2 - (b + ax)\lambda$ . Thus, statement (a) follows.

If  $q = 2$ , then we have  $P(x) = ax + b$  and  $Q(x) = Ax^2 + Bx + C$  with  $aA \neq 0$ , and since  $f_m$  must be a polynomial, we obtain  $f_m = -2a$ ; moreover, in order for  $g_m$  to be a polynomial, we obtain either  $b = B = C = 0$  or  $A = aB/(2b)$  and  $C = (bB)/(2a)$  with  $ab \neq 0$ .

If  $b = B = C = 0$ , then  $g_n = (a^2 - A)x$  and  $F = -Ax^2 + (y - ax)^2$ . Therefore, statement (b) is proven.

If  $A = aB/(2b)$  and  $C = (bB)/(2a)$ , then  $g(x) = (2ab - B)(b + ax)/(2b)$  and  $F(x, y) = -bB/(2a) - Bx - aBx^2/(2b) + (b + ax - y)^2$ . By renaming  $B$  by  $c$ , we obtain statement (c).  $\square$

**Proof of Proposition 2.** We have system (1) with  $g_n(x) = -(f_m(x) + P'(x))P(x)$  and the invariant algebraic curve  $y - P(x) = 0$  is  $P(x) = -F(x) + ax + b$ . Then, by using Equation (2), we obtain the result where the cofactor of the invariant algebraic curve  $y - P(x) = 0$  is  $K = -a$ . Consequently, system (1) has the Darboux invariant (7), which in our case becomes  $I = (y - P(x))e^{at}$ . Hence, statement (a) is proved. Assume now that  $P(x) = b$ . Therefore,  $g(x) = -bf(x)$ , and the differential system becomes  $\dot{x} = y$  and  $\dot{y} = -(y + b)f(x)$ , which has the Darboux first integral  $H = e^{y+F(x)}(y - b)^b$  if  $b \neq 0$ , and the Darboux first integral  $H = y + F(x)$  if  $b = 0$ , as it is easy to verify using (6).  $\square$

**Proof of Proposition 3.** First, we suppose that  $g_n(x) = -(f_m(x) + P'(x))P(x)$ , and we shall prove that  $y - P(x) = 0$  is an invariant algebraic curve. From Equation (7), we have the following.

$$-P'(x)y - yf_m(x) - g_n(x) = K(y - P(x)).$$

By substituting  $g_n(x)$ , we obtain the following.

$$-P'(x)(y - P(x)) - f_m(x)(y - P(x)) = K(y - P(x)).$$

Dividing the previous equality by  $y - P(x)$ , we obtain  $K = -P'(x) - f_m(x)$ , which is a cofactor of degree  $p - 1 + m$  of system (1). Note that the degree of the polynomial Liénard differential system is the degree of, i.e., the maximum of  $m + p$  and  $2p - 1$ .

Now, we assume that  $y - P(x)$  is an invariant algebraic curve of system (1) with cofactor  $K$ . Then, from (7), we obtain

$$-P'(x)y - yf_m(x) - g_n(x) = K(y - P(x)).$$

From this equality, we obtain  $K = K(x)$ ; then, we have

$$(K(x) + f_m(x) + P'(x))y = K(x)P(x) - g_n(x).$$

Therefore,  $K(x) = -(f_m(x) + P'(x))$  and  $g_n(x) = K(x)P(x)$ . Hence,  $g_n(x) = -(f_m(x) + P'(x))P(x)$ , and the proposition is proved.  $\square$

**Proof of Theorem 2.** By Proposition 3, we only need to prove that  $P(x)$  or  $P(x) + F(x)$  are polynomials with a degree of at most one. Since  $m + 1 \geq n$  and  $n$  are the maxima of  $m + p$  and  $2p - 1$  where  $p$  is the degree of the polynomial  $P(x)$ , we have  $m + 1 \geq m + p$ ; consequently,  $p \leq 1$ , and the theorem is proved.  $\square$
