#### Abstract

Two new families of enantiomerically pure carbocyclic nucleoside analogues based on a cyclohexane moiety with five chiral centers and a fused cyclopropyl ring have been synthesized. A highly regio- and stereoselective synthetic approach for the modular construction of the functionalized bicyclo[4.1.0]heptyl azide intermediate 6 has been established. Key steps to achieve this asymmetric synthesis involved highly diastereoselective allylic oxidation and hydroboration reactions. The first family  of compounds, 1a,b and 2, presents different natural nucleobases, whereas the second one $3 \mathbf{a}-\mathrm{e}$ bears functionalized 1,2,3-triazoles. These derivatives have been tested as antiviral agents, and compound 3d has shown to display moderate activity against coxsackie B4 virus.

## - INTRODUCTION

Nucleoside analogues (NAs) are an important class of small molecule-based antivirals, which mainly act by interfering with the metabolism and function of natural nucleosides. These prodrugs constitute the backbone for the treatment of chronic infections provoked by HIV, herpes viruses, and hepatitis B or C viruses. ${ }^{1-3}$ However, only 10 human viral pathogens can be treated with antiviral drugs. ${ }^{4,5}$ Moreover, the SARS-CoV-2 pandemic has emphasized the need for compounds that can respond to future outbreaks provoked by other emerging viruses. Thus, the fight against COVID has renewed the researchers' interest in NAs. ${ }^{0,7}$ In the search for novel antiviral NAs, natural nucleosides have been submitted to several chemical modifications. Among them, those resulting in changes on the sugar moiety and/or on the heterocyclic bases of endogenous nucleosides have led to the development of a series of compounds displaying a wide range of antiviral activity. ${ }^{8}$

Carbocyclic NAs (CNAs) are structurally related to ribonucleosides in which a carbocycle is in the place of the sugar moiety. ${ }^{9,10}$ CNAs are recognized by the same enzymes as natural nucleosides and are more stable toward hydrolysis by phosphorylases displaying enhanced biostability. This family of CNAs includes, among others, the cyclopentene derivatives abacavir and entecavir and the six-membered counterpart cyclohexenyl G (DCG, Figure 1). ${ }^{11}$ In particular, cyclohexenyl nucleosides are an interesting class of antiviral compounds, wherein the presence of a double bond instead of the oxygen atom of the furanose ring produces a comparable annular flexibility to that of the parent nucleoside. ${ }^{\mathrm{P} 2}$ Interestingly,

a, $\mathrm{R}_{1}=\mathrm{CONH}_{2} ; \mathrm{R}_{2}=\mathrm{H}$
b, $\mathrm{R}_{1}=\mathrm{CONH}_{2} ; \mathrm{R}_{2}=\mathrm{NH}_{2}$
c, $\mathrm{R}_{1}=\mathrm{C}_{6} \mathrm{H}_{5} ; \mathrm{R}_{2}=\mathrm{H}$
e, $\mathrm{R}_{1}=\mathrm{CH}_{2} \mathrm{OH} ; \mathrm{R}_{2}=\mathrm{H}$

antiviral activity against some herpes viruses (HSV-1, HSV-2, VZV, CMV) was found to be the same for both enantiomers of

[^0]

DCG. ${ }^{13}$ The conformational restriction of a nucleoside has often been used to enhance selectivity and/or potency against the target enzymes. ${ }^{14,15}$ Reducing the overall number of flexible conformations could favor the adoption of a bioactive conformation and, therefore, molecular recognition by the target enzyme. Some conformationally locked carbocyclic analogues by a fused cyclopropane have been described to present similar conformations than those of the natural counterparts and have shown improved enzyme recognition. ${ }^{16,17}$

On the other hand, modification of the natural nucleobases, including five-membered heterocyclic nucleobases such as a triazole ring, has resulted in the discovery of a series of compounds with a broad spectrum of activities against diverse viruses. ${ }^{2,5,8}$ A remarkable example of this group of compounds is ribavirin, which is a $1,2,4$-triazole nucleoside drug with a wide range of antiviral activities. ${ }^{18}$ 1,2,3-Triazole derivatives have also been reported as antimicrobial, ${ }^{19}$ anticancer, ${ }^{20}$ and potential antiviral ${ }^{21,22}$ agents even in the field of CNAs. ${ }^{23,24}$

Over the past years, our research group has worked on the development of new routes for the enantioselective preparation of cyclohexane NAs as prodrug candidates. ${ }^{25}$ We recently described the design and synthesis of a new class of CNAs based on a bicyclo[4.1.0]heptane scaffold. ${ }^{26}$ As part of our continuing research program to identify bioactive NAs, we were interested in developing novel cyclohexenyl-G derivatives bearing an appended cyclopropyl ring $\mathbf{1 a , b}$ and unnatural bases, such as a triazole heterocycle 3a-e (Figure 1). It was expected that the fusion to a cyclopropane would impart a significant rigidity to the resulting nucleosides similar to that of the cyclohexene moiety but should be less prone to hydrolytic processes and have more lipophilicity. Limiting flexible conformation with a fused cyclopropane is a useful strategy to increase the potency and selectivity of a nucleoside. ${ }^{16,17,27}$

Herein, we present a full account of the stereoselective synthesis and the antiviral testing of several enantiomerically pure six-membered CNAs with five chiral centers starting from 1,4-cyclohexanedione.
The known enantiomerically pure bicyclo[4.1.0]heptane alcohol 4 was envisaged as a suitable starting material (Scheme 1). ${ }^{26}$ The synthetic plan contemplated the preparation of the

Scheme 1. Synthetic Approach Toward CNAs 1a,b and 3a-e

pivotal azide 6 from which thymine and guanine nucleobases would be stepwise constructed and the substituted 1,2,3triazoles would be assembled via cycloaddition. A major challenge of the synthetic approach would be the regio- and stereoselective allylic hydroxylation and olefin hydration on compound 5.

## RESULTS AND DISCUSSION

The synthesis started with alcohol 4 previously prepared in $80 \%$ yield in four steps from commercially available 1,4cyclohexanedione on a multigram scale by a methodology devised in our group (Scheme 2). ${ }^{26}$ Benzyl etherification of the

Scheme 2. Synthesis of Key Azide 6

alcohol under standard conditions, followed by ketal removal under acidic conditions (4:1 mixture of TFA/ $\mathrm{H}_{2} \mathrm{O}$ ), afforded ketone 8 in $77 \%$ for the two steps. Reaction of ketone 8 with freshly prepared ylide generated from methyltriphenylphosphonium iodide $\left(\mathrm{Ph}_{3} \mathrm{PCH}_{3} \mathrm{I}\right)$ and $t$-BuOK afforded the corresponding terminal alkene 5 , which was submitted without further purification to allylic oxidation. Accordingly, compound 5 was treated with catalytic $\mathrm{SeO}_{2}$ and stoichiometric tert-butyl hydroperoxide ${ }^{28,29}$ to furnish the corresponding allylic alcohol 9 as a single diastereoisomer in $79 \%$ yield from ketone 8 . The excellent regio- and stereoselectivity furnished by this oxidation reaction can be rationalized by the generally accepted mechanism that implies two consecutive pericyclic reactions, an ene reaction followed by a [2,3]-sigmatropic rearrangement. ${ }^{30}$ The latter process occurs through the less hindered face delivering the anti-adduct. The anti-relative configuration was determined by a 2D NOESY experiment, where cross peaks between $\mathrm{H}-3$ and H-7endo of the cyclopropane revealed the cis relative disposition between H 3 and cyclopropane.
The next step of our synthetic plan was the stereoselective hydroxymethyl installation by a hydroboration-oxidation procedure. In a first attempt, hydroboration of 9 using $\mathrm{BH}_{3}$. THF followed by alkaline hydrogen peroxide workup furnished a 5:1 mixture of diols $\mathbf{1 0}$ and $\mathbf{1 1}$ in $90 \%$ yield. However, when

Scheme 3. Synthesis of Bicyclic Nucleoside Analogues 1a, 2a, and 19

the reaction was carried out using $9-\mathrm{BBN}$, a $20: 1$ mixture of diols 10 and 11 was obtained in good yield ( $92 \%$ ). The origin of the remarkable stereoselectivity observed might be rationalized by an initial coordination of the borane reagent ( $9-\mathrm{BBN}$ ) to the secondary hydroxyl group. The resulting borinate ester shields the top face, favoring the hydroboration of the olefinic functionality from the bottom face by a second borane reagent. Thus, the mainly formed hydroxymethyl group was found at the top face of the ring. ${ }^{31}$ The hydrolysis of the borate intermediate in the oxidation step under basic conditions delivers mainly alcohol $10 .{ }^{32,33}$ Therefore, in this reaction, more than two equivalents of the borane reagent were employed.
A pure fraction of $\mathbf{1 0}$ was obtained after several purifications by column chromatography from the mixture of diols. The configuration of the new stereogenic center was determined by the 2D NOESY experiment, which displays cross peaks between H-2, H-7endo, and H-4ax disclosing the cis relationship between these three protons. The relative configuration was further confirmed by the cleavage of the benzyl protecting group to deliver the corresponding triol 12, which provided adequate crystals for X-ray diffraction analysis.

Next, reaction of the diastereomeric mixture of diols 10 and 11 with an excess of benzoyl chloride furnished a chromatographically separable mixture of 13 and 14 in 92 and $5 \%$ yields, respectively. Hydrogenation of the benzyl protecting group in 13 under palladium catalysis furnished alcohol 15 in quantitative yield. Finally, alcohol 15 was transformed into azide 6 in $64 \%$ yield following a Mitsunobu protocol ${ }^{34}$ using diphenylphosphoryl azide (DPPA) in the presence of di-tertbutyl azodicarboxylate (DBAD) and triphenylphosphine $\left(\mathrm{PPh}_{3}\right)$. Along with the desired azide, the elimination product 16 was also obtained in low yield (5\%). The configuration of C-5' was determined by the presence of strong cross peaks between $\mathrm{H}-5^{\prime}$ and $\mathrm{H}-7^{\prime}$ endo and $\mathrm{H}-4^{\prime}$ ax and between $\mathrm{H}-5^{\prime}$ and $\mathrm{H}-2^{\prime}$ and $\mathrm{H}-3^{\prime}$ in the NOESY spectrum and was further confirmed by X-ray diffraction analysis. Therefore, the stereocontrolled preparation of the chiral cyclohexane scaffold bearing the five stereogenic centers has been successfully accomplished starting from 1,4-cyclohexanedione.

With 6 in hand, we next examined the stepwise construction of the thymine and guanine nucleobases (Scheme 3). First, catalytic hydrogenation delivered quantitatively the corre-
sponding primary amine, which was isolated as the ammonium chloride salt $\mathbf{1 7}$. Then, the primary amine was treated with the freshly prepared acyl isocyanate $\mathbf{1 8}$ at low temperature in basic media ${ }^{35,36}$ and the formed acryloyl urea was successively heated at reflux in ethanolic acid and treated with 7 M methanolic ammonia solution to furnish the pyrimidine NA 1a in $79 \%$ yield. This compound provided an X-ray crystal structure that confirmed the stereostructure. To prepare epimeric analogue 2, the unprotected NA 1a was subjected to standard Mitsunobu conditions using benzoic acid followed by subsequent alcohol deprotection with an ammonia solution in methanol. ${ }^{17}$ These conditions provided the epimeric NA 2 in $37 \%$ yield along with alkene 19 in $18 \%$ yield. The inversion of the configuration at $\mathrm{C}-3^{\prime}$ was assessed by a NOESY experiment, which exhibited a strong cross peak between $\mathrm{H}-3^{\prime}$ and H-6 of the thymine base. ${ }^{37}$

The guanine base was also assembled from carbocyclic amine 17 (Scheme 4). The purine ring was efficiently built (76\%) through a two-step procedure by reacting 17 first with the diformyl derivative 20 at the reflux temperature and then immediately cyclizing the transiently isolated intermediate in the presence of diethoxymethyl acetate, 21 , at $140^{\circ} \mathrm{C}$ to give

Scheme 4. Synthesis of Bicyclic Guanine Analogue 1b

compound 22. ${ }^{38,39}$ Acidic hydrolysis under reflux followed by reaction with a 7 M solution of $\mathrm{MeNH}_{2}$ in EtOH afforded the desired NA $\mathbf{1 b}$ in $57 \%$ overall yield. Unexpectedly, all attempts to epimerize $\mathbf{C}-\mathbf{3}^{\prime}$ of $\mathbf{1 b}$ using standard Mitsunobu conditions were unsuccessful, resulting in degradation products only.
Our next effort focused on exploiting the common intermediate 6 to build a substituted 1,2,3-triazolo moiety (Schemes 5 and 6). First, the preparation of 1,2,3-triazole-4-

Scheme 5. Synthesis of Bicyclic 1,2,3-Triazolo
Carbanucleosides 3a and 3b

Scheme 6. Synthesis of Bicyclic 1,2,3-Triazolo
Carbanucleosides 3c-3e

3c, $\mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{5}$ (97\%)
3d, $\mathrm{R}=p-{\mathrm{Et}-\mathrm{C}_{6} \mathrm{H}_{5} \text { (96\%) }}^{(96)}$
3e, $\mathrm{R}=\mathrm{CH}_{2} \mathrm{OH}(80 \%)$
carboxamide ribavirin analogues was attempted via copper(I)catalyzed azide alkyne cycloaddition (CuAAC) using standard conditions. ${ }^{40}$ Thus, azide 6 was reacted with methyl propiolate 23 in the presence of $\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mol} \%)$ and sodium ascorbate ( $20 \mathrm{~mol} \%$ ) in a $2: 1 \mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$ mixture overnight. Unfortunately, only starting material was recovered, as the reaction did not work. The same result was obtained using MeOH or $t$-BuOH. Alcohol deprotection to increase the solubility of 6 was precluded due to the known conjugated addition of alcohols on the methyl propiolate. ${ }^{40}$ After some experimentation, it was found that using a $2: 1$ mixture of $\mathrm{ACN} / \mathrm{H}_{2} \mathrm{O}$, the cycloaddition proceeded readily to deliver the 4 -metylcarboxylate triazole 24 in $79 \%$ yield. The latter was further easily transformed into the 1,2,3-triazole-4-carboxamide carbanucleoside 3a by treatment with an ammonia solution in methanol (Scheme 5). Next, to explore more structural
diversity, efforts were focused on the synthesis of a 5 -amino4 -carboxamide-1,2,3-triazolo carbanucleoside $3 \mathbf{b}$ related to acadesine ${ }^{41}$ using a known cycloaddition reaction under basic conditions. ${ }^{42-44}$ Accordingly, azide 6 was treated with 2-cyanoacetamide 25 in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in DMSO at $50{ }^{\circ} \mathrm{C}$ to afford directly the $1,4,5$-trisubstituted-triazolo deprotected carbanucleoside $\mathbf{3 b}$ in moderate yield.

Finally, to expand the collection of NAs bearing triazole rings, the syntheses of various 4 -substituted triazole compounds were undertaken starting from terminal alkynes $27 \mathrm{c}-\mathbf{e}$ via CuAAC (Scheme 6). First, to avoid the previously described solubility issues of $\mathbf{6}$, the benzoyl protecting groups were removed using an ammonia solution in methanol providing the deprotected azide 26 in $85 \%$ yield. Then, 26 was reacted with alkynes $27 \mathrm{c}-\mathrm{e}$ using a $\mathrm{Cu}^{0} / \mathrm{CuSO}_{4}$ mixture in $t$ - $\mathrm{BuOH} / \mathrm{H}_{2} \mathrm{O}(1: 1)$ media under microwave (MW) irradiation delivering the expected 4 -substituted-1,2,3-triazole carbanucleosides $3 \mathbf{c}-\mathbf{e}$ in good yields in short reaction times.

The regioselectivity of the cycloaddition reactions (Schemes 5 and 6) was confirmed by HMBC experiments in compounds $\mathbf{3 a}-\mathbf{3 e}$, which show cross peaks between $\mathrm{H}-\mathbf{1}^{\prime}$ of the bicyclo[4.1.0]heptane moiety and C-5 of the 1,2,3-triazole ring.

The antiviral activity against various viruses and the cytotoxicity of the synthesized compounds $\mathbf{1 a}, \mathbf{b}, \mathbf{2}, \mathbf{1 9}$, and 3a-e have been tested, as shown in the Supporting Information. While all the carbocyclic nucleosides did not display any significant antiviral activity, the 1,2,3-triazole analogue 3d exhibited moderate antiviral activity $\left[\mathrm{EC}_{50} 9.4\right.$ $\mu \mathrm{g} / \mathrm{mL}$, selectivity index $(\mathrm{SI})=8.4]$ against coxsackie B4 virus. The coxsackie virus causes a great variety of diseases such as myocarditis ${ }^{45}$ or pericarditis, ${ }^{46}$ or aseptic meningitis, ${ }^{47}$ and is one of the main enteroviruses causing the hand, foot, and mouth disease in children under the age of $10 .^{48}$ Moreover, coxsackie B 4 virus has been related to the infection of $\beta$ cells in patients with type 1 diabetes and that infection is associated with inflammation and functional impairment. ${ }^{49}$ Precedents of active NAs against coxsackie B4, using ribavirin derivatives, showed similar antiviral activity to our compounds. ${ }^{50}$ Remarkably, a seminal work using neplanocin-related CNAs described higher activities against coxsackie B4. ${ }^{51}$ Interestingly, another precedent using CNAs pointed out that the use of cyclopentenyl derivatives showed higher activity against coxsackie B4 than the corresponding saturated counterparts. ${ }^{52}$ Recently, other non-CNAs have been described with important antiviral activity toward the closely related coxsackie B3 virus. ${ }^{53,54}$ In one of these works, the use of 1,2,3-triazole-based non-natural nucleobases proved to be effective to improve the antiviral activity. ${ }^{54}$ However, in other cases, the use of nonnatural nucleobases in linear CNAs has not led to significant antiviral activity against coxsackie B4 virus. ${ }^{55,56}$ Despite all these precedents, at present, there is no approved specific treatment for coxsackie virus infections. The preliminary in vitro antiviral activity of the novel synthesized carbocyclic nucleoside 3d opens the door to carry out additional studies of structure-activity relationships as well as studies of the mode of action.

## - CONCLUSIONS

In summary, a highly stereoselective route to enantiomerically pure $4^{\prime}$-hydroxymethyl-3'-hydroxybicyclo[4.1.0]heptyl NAs has been finely tuned, from a common azide derivative 6, which in turn derives from 1,4-cyclohexandione. Key achieve-
ments in the asymmetric synthesis of these CNAs have been the highly diastereoselective allylic oxidation and hydroboration reactions. Four of them, 1a, its epimer 2, the related alkene derivative 19, and $\mathbf{1 b}$, contain thymine and guanine, respectively, which have been constructed stepwise from 6. The other five CNAs, 3a-3e, incorporate 1,2,3-triazoles as nucleobase and have been prepared from 6 in excellent yields via cycloadditions. It is noteworthy that, although most of the compounds do not display relevant antiviral activity, compound 3d has shown interesting antiviral activity against coxsackie B4 virus. Because to date there are no approved treatments against this virus, this preliminary result prompts us to further study this privileged scaffold.

## ■ EXPERIMENTAL SECTION

General Methods. Unless otherwise indicated, all reagents and solvents were purchased from commercial sources and used directly as received. Solvents were dried by distillation over the appropriate drying agents. In the reaction mixtures that require heating, the indicated temperatures refer to those of the used oil bath. All the reactions were monitored by analytical thin-layer chromatography (TLC) using silica gel 60 F254 pre-coated aluminum plates ( 0.25 mm thickness). TLC spots were detected under UV light and/or by charring with a $\mathrm{KMnO}_{4} / \mathrm{KOH}$ aqueous solution or Vanillin solution. Flash column chromatography was performed using silica gel (230400 mesh). ${ }^{1} \mathrm{H}$ NMR spectra were recorded using 400 MHz and were referenced to the residual proton signals of $\mathrm{CDCl}_{3}, 7.26 \mathrm{ppm}$, and $\mathrm{MeOH}-d_{4}, 3.31 \mathrm{ppm} .{ }^{13} \mathrm{C}\left[{ }^{1} \mathrm{H}\right]$ NMR spectra were recorded at 100 MHz and were referenced to the residual ${ }^{13} \mathrm{C}$ signal of $\mathrm{CDCl}_{3}, 77.16$ ppm , and $\mathrm{MeOH}-d_{4}, 49.00 \mathrm{ppm}$. Structural assignments were made with additional information from gCOSY , gHSQC , and gHMBC experiments. Melting points were determined on a hot stage and are uncorrected. Optical rotations were measured at $20 \pm 2{ }^{\circ} \mathrm{C}$ at the sodium D line ( 589 nm ) in a microcell $(0.1 \mathrm{dm})$. Infrared spectra were recorded on a spectrophotometer equipped with a Golden Gate Single Refraction Diamond ATR (Attenuated Total Reflectance) accessory. High-resolution mass spectra were recorded using electrospray ionization (ESI).
MW reactions were conducted on a CEM Discover Microwave synthesizer. The machine includes a continuous focused MW-power delivery system with operator-selectable power output from 0 to 300 W. The temperature inside the vessel was monitored by a calibrated infrared temperature control attached under the reaction vessel. All experiments were carried out under stirring by means of a rotating magnetic plate located below the floor of the MW cavity and a Tefloncoated magnetic stir bar in the vessel. All the experiments were carried out in a sealed reaction vessel.
Evaluation of Antiviral Activity. Antiviral Activity Assays. The antiviral screening of compounds $\mathbf{1 a}, \mathbf{1 b}, \mathbf{2}, \mathbf{1 9}$, and $\mathbf{3 a - e}$ was performed against herpes simplex virus-1 (KOS) [HSV-1 KOS], herpes simplex virus-2 (G) [HSV-2 G], Vaccinia virus [VV], adenovirus 2, and human coronavirus (229E) in HEL cell cultures; vesicular stomatitis virus [VSV], coxsackie virus B4, and respiratory syncytial virus in Hep-2 cell cultures; Reovirus-1, Sindbis virus, coxsackie virus B4, Punta Toro virus, yellow fever virus, and Zika virus in Vero cell cultures; Influenza A virus A/Ned/378/05A (H1N1), Influenza A virus A/HK/7/87 (H3N2), and Influenza B virus B/ Ned/537/05 in MDCK cell cultures; and human immunodeficiency virus type 1 (HIV-1) (IIIB) and HIV-2 (ROD) in MT-4 cell cultures. The results were expressed as the $50 \%$ effective concentration (EC50) or drug concentration required to inhibit virus-induced cytopathicity by $50 \%$. Read-out was through microscopical inspection or the MTS viability staining method.

Confluent cell cultures in microtiter 96 -well plates were inoculated with 100 CCID50 of the virus (one CCID50 being the dose of the virus sufficient to infect $50 \%$ of the cell cultures) in the presence of varying concentrations of the test compounds. Viral cytopathicity was recorded as soon as it reached completion in the control virus-
infected cell cultures that had not been treated with the test compounds.

Cytotoxic Assays. The cytotoxicity of the compounds was evaluated in parallel with their antiviral activity in uninfected cell cultures and is expressed as the $50 \%$ cytotoxic concentration (CC50) as determined by measuring the cell viability of normal cell morphology (HEL, Hep-2, MDCK, and Vero cells) with the colorimetric formazan-based MTS assay.
( $1 R, 4^{\prime} R, 5 R, 5^{\prime} R, 6 S$ )-5-(Benzyloxy)-4', $5^{\prime}$-diphenylspiro-[bicyclo[4.1.0]-heptane-2,2'-[1,3]dioxolane] (7). To an icecooled solution of alcohol $4^{26}(3.02 \mathrm{~g}, 9.37 \mathrm{mmol})$ in anhydrous THF ( 90 mL ), NaH ( $1.27 \mathrm{~g}, 31.8 \mathrm{mmol}$ ) was added in one portion and the mixture was stirred for 1 h at $0^{\circ} \mathrm{C}$. Then, benzyl bromide ( 1.3 $\mathrm{mL}, 11.24 \mathrm{mmol})$ and sodium iodide $(1.73 \mathrm{~g}, 11.5 \mathrm{mmol})$ were added at $0^{\circ} \mathrm{C}$ and the mixture was stirred at the reflux temperature for 3 h . After that time, water ( 60 mL ) was carefully added at RT and stirred for 15 min . Then, EtOAc ( 30 mL ) was added, and the aqueous layer was extracted with more EtOAc $(2 \times 30 \mathrm{~mL})$. The organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated under reduced pressure, and purified by column chromatography ( $\mathrm{SiO}_{2}$, hexanes:EtOAc, 6:1) to furnish 7 ( $3.29 \mathrm{~g}, 7.96 \mathrm{mmol}, 85 \%$ yield) as a pale oil.
4. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.37-7.28$ (m, $8 \mathrm{H}, \mathrm{H}-\mathrm{Ar}$ ), $7.23-7.19(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-\mathrm{Ar}), 4.83\left(\mathrm{~d}, J_{5^{\prime} 4^{\prime}}=9.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5^{\prime}\right), 4.70(\mathrm{~d}$, $\left.J_{4^{\prime}, 5^{\prime}}=9.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-4^{\prime}\right), 4.35\left(\mathrm{q}, J_{5,4 \mathrm{ax}}=J_{5,4 \mathrm{eq}}=J_{5,6}=5.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-\right.$ 5), $1.94-1.81(\mathrm{~m}, 3 \mathrm{H}, 2 \mathrm{H}-3, \mathrm{H}-4 \mathrm{eq}), 1.70-1.55(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-1, \mathrm{H}-6)$, $1.56-1.41(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-4 \mathrm{ax}), 0.96\left(\mathrm{q}, J_{7 \text { endo }, 1}=J_{7 \text { endo }, 6}=J_{\text {gem }}=5.7 \mathrm{~Hz}\right.$, $1 \mathrm{H}, \mathrm{H}-7 \mathrm{endo}$ ), 0.83 (td, $J_{7 \mathrm{exo}, 1}=J_{7 \text { exe }, 6}=9.4 \mathrm{~Hz}, J_{\mathrm{gem}}=5.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-$ 7exo).
7. $R_{\mathrm{f}}=0.68$ (hexanes:EtOAc, 1:1); $[\alpha]_{\mathrm{D}}{ }^{20}+45.6\left(c 1.03, \mathrm{CHCl}_{3}\right)$; ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.46(\mathrm{~m}, 3 \mathrm{H}, \mathrm{H}-\mathrm{Ar}), 7.43-7.34(\mathrm{~m}$, $8 \mathrm{H}, \mathrm{H}-\mathrm{Ar}$ ), $7.32-7.28$ ( $\mathrm{m}, 4 \mathrm{H}, \mathrm{H}-\mathrm{Ar}$ ), 4.94 (d, $J_{5^{\prime}, 4^{\prime}}=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-$ $5^{\prime}$ ), 4.86-4.75 (m, 2H, H-4', CH ${ }_{2}-\mathrm{Ph}$ ), $4.59\left(\mathrm{~d}, J_{\mathrm{gem}}=11.8 \mathrm{~Hz}, 1 \mathrm{H}\right.$, $\left.\mathrm{CH}_{2}-\mathrm{Ph}\right), 4.15\left(\mathrm{q}, J_{5,6}=J_{5,4}=5.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5\right), 1.99-1.80(\mathrm{~m}, 4 \mathrm{H}$, $\mathrm{H}-4, \mathrm{H}-3), 1.72-1.58(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-6, \mathrm{H}-1), 1.12\left(\mathrm{q}, J_{\mathrm{gem}}=J_{7 \text { endo, } 1}=\right.$ $J_{\text {7endo }, 6}=5.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-7$ endo $), 1.03\left(\mathrm{td}, J_{7 \text { exo }, 6}=J_{7 \text { exe }, 1}=9.1 \mathrm{~Hz}, J_{\text {gem }}\right.$ $=5.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-7 \mathrm{exo})$; ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 139.1$ (CAr), 137.1/136.9 (CAr), 128.5/128.5/128.4/128.3/127.8/127.5/ 126.9/126.7 (CAr), 109.8 (C2), 85.6/85.3 (C4',C5'), 70.7 (C5), 69.6 ( $\mathrm{CH}_{2} \mathrm{Ph}$ ), 30.2 (C3), 26.6 (C4), 22.4 (C1), 16.5 (C6), 5.5 (C7); IR (ATR) $3063,2850,2524,2108,1729,1495,1453,1060,697 \mathrm{~cm}^{-1}$; HRMS (ESI+) $m / z$ : $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{28} \mathrm{H}_{29} \mathrm{O}_{3}$ 413.2117; found 413.2119.
(1R,5R,6S)-5-(Benzyloxy)bicyclo[4.1.0]heptan-2-one (8). To a stirred solution of ketal $7(5.03 \mathrm{~g}, 12.19 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(120$ $\mathrm{mL})$, a $4: 1$ mixture of TFA $(2.8 \mathrm{~mL}, 36.57 \mathrm{mmol}) / \mathrm{H}_{2} \mathrm{O}(700 \mu \mathrm{~L})$ was added at RT. The reaction mixture was allowed to stir for 2 h . Then, additional $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$ was added, and the resulting solution was washed with saturated aqueous $\mathrm{NaHCO}_{3}$ solution ( 100 mL ). The organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated under reduced pressure, and purified by column chromatography ( $\mathrm{CHCl}_{3} 100 \%$ ) to provide $8\left(2.401 \mathrm{~g}, 11.10 \mathrm{mmol}, 91 \%\right.$ yield) as a yellowish oil. $R_{f}=$ $0.22\left(\mathrm{CHCl}_{3}\right) ;[\alpha]_{\mathrm{D}}{ }^{20}+62.6\left(c 1.45, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ) $\delta 7.39-7.34(\mathrm{~m}, 4 \mathrm{H}, \mathrm{H}-\mathrm{Ar}), 7.32-7.28(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-\mathrm{Ar}), 4.73$ $\left(\mathrm{d}, J_{\mathrm{gem}}=11.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{Ph}\right), 4.64\left(\mathrm{~d}, J_{\mathrm{gem}}=11.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2}-\right.$ $\mathrm{Ph}), 4.15\left(\mathrm{dt}, J_{5,4 \mathrm{ax}}=9.3 \mathrm{~Hz}, J_{5,4 \mathrm{eq}}=J_{5,6}=4.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5\right), 2.42(\mathrm{dt}$, $\left.J_{\mathrm{gem}}=17.7 \mathrm{~Hz}, J_{3 \mathrm{eq}, 4}=5.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-3 \mathrm{eq}\right), 2.12\left(\mathrm{ddd}, J_{\mathrm{gem}}=17.7 \mathrm{~Hz}\right.$, $\left.J_{3 \mathrm{ax}, 4 \mathrm{x}}=10.7 \mathrm{~Hz}, J_{3 \mathrm{ax}, 4 \mathrm{eq}}=6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-3 \mathrm{ax}\right), 2.05-1.93(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-$ 4), $1.88-1.71(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-1, \mathrm{H}-6), 1.50\left(\mathrm{q}, J_{\mathrm{gem}}=J_{7 \text { endo }, 6}=J_{7 \text { endo }, 1}=5.4\right.$ $\mathrm{Hz}, 1 \mathrm{H}, \mathrm{H}-7 \mathrm{endo}$ ), 1.24 (td, $J_{7 \text { exa }, 6}=J_{7 \text { exo }, 1}=9.1 \mathrm{~Hz}, J_{\text {gem }}=5.4 \mathrm{~Hz}$, $1 \mathrm{H}, \mathrm{H}-7 \mathrm{exo})$; ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 208.2$ (C2), 138.5 (CAr), 128.6/128.2/127.9/127.8 (CAr), 71.3 (C5), $70.6\left(\mathrm{CH}_{2} \mathrm{Ph}\right)$, 34.4 (C3), 26.5 (C4), 25.5 (C1), 21.3 (C6), 9.5 (C7); IR (ATR) 3028, 2857, 1692, 1342, 1075, 1028, 881, $631 \mathrm{~cm}^{-1}$; HRMS (ESI + ) $\mathrm{m} / \mathrm{z}:[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{14} \mathrm{H}_{17} \mathrm{O}_{2}$ 217.1229; found 217.1231.
(1S,2R,6R)-2-(Benzyloxy)-5-methylidenebicyclo[4.1.0]heptane (5) and (1R,3R,5R,6S)-5-(benzyloxy)-2-methylidenebicyclo[4.1.0]heptan-3-ol (9). To a stirring solution of $\mathrm{Ph}_{3} \mathrm{PCH}_{3} \mathrm{I}(11.82 \mathrm{~g}, 29.2 \mathrm{mmol})$ in anhydrous THF $(30 \mathrm{~mL})$ at 0 ${ }^{\circ} \mathrm{C}, t$-BuOK ( $3.31 \mathrm{~g}, 29.5 \mathrm{mmol}$ ) was added, under a nitrogen atmosphere, and the resulting yellow mixture was allowed to react for

1 h . At this time, a solution of ketone $8(1.27 \mathrm{~g}, 5.8 \mathrm{mmol})$ in anhydrous THF ( 10 mL ) was added and the mixture was stirred for 3 h. Then, diethyl ether ( 30 mL ) was added, and the crude filtered through a pad of silica and Celite, using more diethyl ether ( 100 mL ) as eluent. The volatiles were removed under vacuum to obtain $\mathbf{5}$ as an orange oil, which is unstable was directly used for the next step without further purification. Accordingly, crude alkene 5 was rapidly dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(75 \mathrm{~mL})$ and $\mathrm{SeO}_{2}(128 \mathrm{mg}, 1.16 \mathrm{mmol})$ and $t$ BuOOH ( $440 \mu \mathrm{~L}, 6.38 \mathrm{mmol}, 70 \%$ in water) were sequentially added at RT. After stirring for 20 min , water ( 50 mL ) was added, and the aqueous phase was extracted with more $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 30 \mathrm{~mL})$. Finally, the organic layers were dried with anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, concentrated under reduced pressure, and purified by column chromatography (hexanes:EtOAc, $5: 1$ ) to provide allylic alcohol 9 ( $1.05 \mathrm{~g}, 4.55 \mathrm{mmol}$, $79 \%$ overall yield from 8) as brown oil.

An aliquot of compound $\mathbf{5}$ was purified by column chromatography (hexanes:EtOAc, 5:1); however, due to its instability, the obtained HRMS analysis was not within the 10 ppm acceptable error: $R_{f}=0.75$ (hexanes:EtOAc, 2:1); $[\alpha]_{\mathrm{D}}{ }^{20}=+47.6$ (c 0.98, $\mathrm{CHCl}_{3}$ ); ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.46-7.25(\mathrm{~m}, 5 \mathrm{H}, \mathrm{H}-\mathrm{Ar}), 4.90(\mathrm{br} \mathrm{s}, 1 \mathrm{H}, \mathrm{H}-$ $1^{\prime}$ ), 4.79 (br s, 1H, H-1'), 4.74 (d, $J_{\mathrm{gem}}=11.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{Ph}$ ), 4.56 (d, $\left.J_{\text {gem }}=11.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{Ph}\right), 4.05\left(\mathrm{q}, J_{2,3 \mathrm{ax}}=J_{2,3 \mathrm{seq}}=J_{2,1}=5.9 \mathrm{~Hz}\right.$, $1 \mathrm{H}, \mathrm{H}-2), 2.21$ (dddt, $J_{\text {gem }}=14.9 \mathrm{~Hz}, J_{4 \mathrm{ax}, 3 \mathrm{ax}}=8.5 \mathrm{~Hz}, J_{4 \mathrm{ax}, 3 \text { eq }}=4.4 \mathrm{~Hz}$, $J_{4 \mathrm{ax}, 1^{\prime}}=1.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-4 \mathrm{ax}$ ), 2.03 (dddt, $J_{\text {gem }}=14.9 \mathrm{~Hz}, J_{4 \text { eq }, 3 \mathrm{ax}}=7.2$ $\left.\mathrm{Hz}, J_{4 e q, 3 e q}=4.3 \mathrm{~Hz}, J_{4 e q, 1^{\prime}}=1.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-4 \mathrm{eq}\right), 1.88-1.75(\mathrm{~m}, 1 \mathrm{H}$, $\mathrm{H}-6), 1.71-1.50(\mathrm{~m}, 3 \mathrm{H}, \mathrm{H}-1, \mathrm{H}-3), 0.94-0.84(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-7)$; ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $\left.100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 146.3$ (C5), 139.1 (Cipso), 128.4/127.7/127.5 (CAr), 108.1 ( $\left.\mathrm{C}^{\prime}\right), 72.0$ (C2), $69.7\left(\mathrm{CH}_{2} \mathrm{Ph}\right)$, 28.8 (C4), 27.7 (C3), 19.9 (C1), 17.0 (C6), 8.7 (C7); IR (ATR) 3070, 2930, 1471, 1427, 1106, 806, $741 \mathrm{~cm}^{-1}$; HRMS (ESI+) $\mathrm{m} / \mathrm{z}$ : $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{O}$ 215.1436; found 215.1465.

[( $\left.1^{\prime} R, 2^{\prime} R, 3^{\prime} R, 5^{\prime} S, 6^{\prime} S\right)$-5'-Amino-3'-(benzoyloxy)bicyclo-[4.1.0]hept-2'-yl]methyl Benzoate Hydrochloride (17). A stirred solution of azide $6(615 \mathrm{mg}, 1.57 \mathrm{mmol})$ in EtOAc ( 16 mL ) was hydrogenated in the presence of $\mathrm{Pd} / \mathrm{C}(61.5 \mathrm{mg}, 10 \mathrm{wt} \%)$ at 2 atm for 24 h at RT. Then, the mixture was filtered through a short pad of Celite and rinsed with more EtOAc. The solvent was evaporated under reduced pressure, and the crude was treated with 2 M HCl $\mathrm{Et}_{2} \mathrm{O}(1 \mathrm{~mL}, 2 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$ and stirred for 15 min . The suspension was filtered to furnish a white solid identified as the ammonium salt 17 ( $618 \mathrm{mg}, 1.54 \mathrm{mmol}, 98 \%$ yield). $\mathrm{Mp}>210-215{ }^{\circ} \mathrm{C}$ (decomposes) (from $\mathrm{Et}_{2} \mathrm{O}$ ); $[\alpha]_{\mathrm{D}}{ }^{20}{ }^{-} 33.5\left(c 0.82, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{MeOH}-d_{4}\right) \delta 8.05$ (d, $J_{\text {orto,meta }}=7.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-$ orto $), 7.92$ (d, $J_{\text {orto,meta }}=7.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}$-orto), $7.65-7.52$ (m, 2H, H-para), $7.50-$ $7.36(\mathrm{~m}, 4 \mathrm{H}, \mathrm{H}-\mathrm{meta}), 5.43\left(\mathrm{dt}, J_{3^{\prime}, 4^{\prime} \mathrm{xx}}=6.3 \mathrm{~Hz}, J_{3^{\prime}, 4^{\prime} \mathrm{eq}}=J_{3^{\prime}, 2^{\prime}}=4.3 \mathrm{~Hz}\right.$, $\left.1 \mathrm{H}, \mathrm{H}-3^{\prime}\right), 4.63-4.56(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-1), 3.61\left(\mathrm{br} \mathrm{t}, J_{5^{\prime}, 4^{\prime} \mathrm{eq}}=J_{5^{\prime} 4^{\prime} \mathrm{ax}}=6.4\right.$ $\left.\mathrm{Hz}, 1 \mathrm{H}, \mathrm{H}-5^{\prime}\right), 2.49\left(\mathrm{tt}, J_{2^{\prime}, 1}=7.7 \mathrm{~Hz}, J_{2^{\prime}, 3^{\prime}}=J_{2^{\prime}, 1^{\prime}}=4.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2^{\prime}\right)$, $2.19\left(\mathrm{dt}, J_{\mathrm{gem}}=14.7 \mathrm{~Hz}, J_{4^{\prime} \mathrm{eq}, 3^{\prime}}=J_{4^{\prime} \mathrm{eq}, 5}=4.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-4^{\prime} \mathrm{eq}\right), 1.99$ (dt, $J_{\mathrm{gem}}=14.7 \mathrm{~Hz}, J_{4^{\prime} \mathrm{ax}, 3^{\prime}}=J_{4^{\prime} \mathrm{ax},,^{\prime}}=6.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-4^{\prime} \mathrm{ax}$ ), $1.33-1.19$ $\left(\mathrm{m}, 2 \mathrm{H}, \mathrm{H}-1^{\prime}, \mathrm{H}-6^{\prime}\right), 1.11\left(\mathrm{td}, J_{7^{\prime} \text { endo }, 6}=J_{7^{\prime} \text { endo }, 1}=8.9 \mathrm{~Hz}, J_{\text {gem }}=5.4 \mathrm{~Hz}\right.$, $1 \mathrm{H}, \mathrm{H}^{\prime} 7^{\prime} \mathrm{exo}$ ), 0.52 ( $q, J_{\text {gem }}=J_{7^{\prime} \text { endo }, 6^{\prime}}=J_{7^{\prime} \text { endo }, 1^{\prime}}=5.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-$ $7^{\prime}$ endo); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $\left.100 \mathrm{MHz}, \mathrm{MeOH}-d_{4}\right) \delta 167.7$ (CO), 167.2 (CO), 134.6 (Cpara), 134.3 (Cpara), 131.1 (Cipso), 131.0 (Cipso), 130.7 (Corto), 130.5 (Corto), 129.7 (Cmeta), 129.5 (Cmeta), 69.0 (C3'), 65.9 (C1), 47.6 ( $\mathrm{C}^{\prime}$ ), 38.3 (C2'), 30.6 ( $\mathrm{C}^{\prime}$ ), 13.9 ( $\mathrm{C}^{\prime}$ ), 12.3 (C1'), 11.3 (C7'); IR (ATR) 3048, 2922, 1714, 1615, 1514, 1269, 1099, $708 \mathrm{~cm}^{-1}$; HRMS (ESI+) $m / z:[M]^{+}$calcd for $\mathrm{C}_{22} \mathrm{H}_{24} \mathrm{NO}_{4}$ 366.1705; found 366.1703.

1-(( $\left.1^{\prime} S, 2^{\prime} S, 4^{\prime} R, 5^{\prime} R, 6^{\prime} R\right)-4^{\prime}$-Hydroxy-5'-(hydroxymethyl) bicyclo[4.1.0]heptan-2'-yl)-5-methylpyrimidine-2,4(1H,3H)dione (1a). To a suspension of silver cyanate ( $235 \mathrm{mg}, 1.57 \mathrm{mmol}$ ), previously dried over phosphorus pentoxide at $80^{\circ} \mathrm{C}$ in a laboratory oven for 3 h , in dry toluene ( 3 mL ), a solution of ( $E$ )-3-ethoxy-2methylacryloyl chloride ( $196 \mathrm{mg}, 1.32 \mathrm{mmol}$ ) was added dropwise in dry toluene ( 0.8 mL ). The heterogeneous mixture was refluxed in an oil bath under an argon atmosphere for 1.5 h before allowing it to cool to RT. The precipitate was allowed to settle, and the supernatant was transferred via a cannula to a dry Schlenk flask. The precipitate was further washed with a small quantity of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ and transferred to the same flask to deliver a solution of the isocyanate 18. This solution was cooled to $-78^{\circ} \mathrm{C}$, and a solution of the ammonium salt $17(175 \mathrm{mg}, 0.44 \mathrm{mmol})$ with $\mathrm{Et}_{3} \mathrm{~N}(65 \mu \mathrm{~L}, 0.47 \mathrm{mmol})$ in dry
$\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.5 \mathrm{~mL})$ was added dropwise over 3 min . The solution was allowed to warm slowly to RT and stirred overnight ( 16 h ). EtOH (3 mL ) was added, and the reaction mixture was concentrated in vacuo. To the crude residue, $\mathrm{EtOH}(4 \mathrm{~mL})$ and $2 \mathrm{M} \mathrm{HCl}(1.25 \mathrm{~mL}, 2.5$ mmol ) were added. The reaction mixture was refluxed overnight in an oil bath ( 20 h ) then cooled to RT, and the solution was concentrated in vacuo. The residue was dissolved in a $33 \%$ solution of methylamine in $\mathrm{EtOH}(50 \mathrm{~mL})$ in a sealed flask and stirred for 48 h at RT. Then, the mixture was concentrated under reduced pressure and purified by column chromatography ( $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ : $\mathrm{MeOH}, 20: 1 \rightarrow 15: 1$ ) to provide the NA 1a ( $92 \mathrm{mg}, 0.36 \mathrm{mmol}, 79 \%$ overall yield) as a white solid, which was crystallized by vapor diffusion using the $\mathrm{MeOH}-\mathrm{Et}_{2} \mathrm{O}$ mixture at low temperature. $R_{f}=0.26\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH} 1: 1\right) ; \mathrm{Mp}$ $189-191{ }^{\circ} \mathrm{C}$ (from $\mathrm{MeOH} / \mathrm{Et}_{2} \mathrm{O}$ ); $[\alpha]_{\mathrm{D}}{ }^{20}+63.8$ (c $\left.0.47, \mathrm{MeOH}\right)$; ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{MeOH}-d_{4}\right) \delta 7.82\left(\mathrm{q}, \mathrm{J}_{6, \mathrm{CH} 3}=1.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-6\right)$, $4.77\left(\mathrm{td}, J_{2^{\prime}, 3^{\prime} \mathrm{ax}}=J_{2^{\prime}, 3^{\prime} \mathrm{eq}}=6.3, J_{2^{\prime}, 1^{\prime}}=1.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2^{\prime}\right), 3.89\left(\mathrm{dd}, J_{\mathrm{gem}}\right.$ $\left.=10.7 \mathrm{~Hz}, J_{1^{\prime \prime}, 5^{\prime}}=6.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-1^{\prime \prime}\right), 3.86-3.80\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-4^{\prime}, \mathrm{H}-\right.$ $\left.1^{\prime \prime}\right), 1.89\left(\mathrm{~d}, J_{\mathrm{CH} 3,6}=1.1 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.87-1.82\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-3^{\prime} \mathrm{eq}\right.$, H-5'), 1.63 (ddd, $J_{\text {gem }}=14.2 \mathrm{~Hz}, J_{3^{\prime} \mathrm{ax}, 2^{\prime}}=6.3 \mathrm{~Hz}, J_{3^{\prime} \mathrm{ax}, 4^{\prime}}=2.9 \mathrm{~Hz}, 1 \mathrm{H}$, H-3'ax), 1.17 (tdd, $J_{6^{\prime}, 7^{\prime} \text { exo }}=J_{6^{\prime}, 1^{\prime}}=8.5 \mathrm{~Hz}, J_{6^{\prime}, 7^{\prime} \text { endo }}=5.5 \mathrm{~Hz}, J_{6^{\prime} '^{\prime}}=2.6$ $\left.\mathrm{Hz}, 1 \mathrm{H}, \mathrm{H}-6^{\prime}\right), 1.06$ (tdd, $J_{1^{\prime}, 7^{\prime} \text { exo }}=J_{1^{\prime} 6^{\prime}}=8.5 \mathrm{~Hz}$, $J_{1^{\prime} 7^{\prime} \text { endo }}=6.2 \mathrm{~Hz}, J_{1^{\prime} 2^{\prime}}$ $\left.=1.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-1^{\prime}\right), 0.91\left(\mathrm{td}, J_{7^{\prime} \text { exo, } 6^{\prime}}=J_{7^{\prime} \text { exo }, 1^{\prime}}=8.5 \mathrm{~Hz}, J_{\mathrm{gem}}=5.3 \mathrm{~Hz}\right.$, $1 \mathrm{H}, \mathrm{H}-7^{\prime}$ exo), 0.23 ( $\mathrm{q}, J_{\text {gem }}=J_{7^{\prime} \text { endo, } 1^{\prime}}=J_{7^{\prime} \text { endo }, 6^{\prime}}=5.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-$ $7^{\prime}$ endo) ; ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $\left.100 \mathrm{MHz}, \mathrm{MeOH}-d_{4}\right) \delta 166.7$ (C2), 153.0 (C4), 141.9 (C6), 110.2 (C5), 65.7 (C4'), 64.4 ( $\left.\mathrm{C1}^{\prime \prime}\right), 52.1$ (C2'), 42.4 ( $\mathrm{C}^{\prime}$ ), 33.6 ( $\mathrm{C}^{\prime}$ ), $14.5\left(\mathrm{Cl}^{\prime}\right), 13.6\left(\mathrm{C}^{\prime}\right), 12.5\left(\mathrm{CH}_{3}\right), 11.1(\mathrm{C}-$ $7^{\prime}$ ); IR (ATR) 3483, 3270, 3019, 2885, 2360, 1700, 1660, 1269, 1002, $847 \mathrm{~cm}^{-1}$; HRMS (ESI+) $\mathrm{m} / \mathrm{z}:[\mathrm{M}+\mathrm{H}]^{+}$: calcd for $\mathrm{C}_{13} \mathrm{H}_{19} \mathrm{~N}_{2} \mathrm{O}_{4}$ 267.1345; found 267.1344.

1-[(1'S,2'S, $\left.4^{\prime} S, 5^{\prime} R, 6^{\prime} R\right)-4^{\prime}-H y d r o x y-5^{\prime}$-(hydroxymethyl)-bicyclo[4.1.0]hept-2'-yl]-5-methylpyrimidine-2,4(1H,3H)dione (2) and 1-[( $\left.1^{\prime} S, 2^{\prime} S, 6^{\prime} R\right)$-5'-(hydroxymethyl)-bicyclo-[4.1.0]hept-4'-en-2'-yl]-5-methylpyrimidine-2,4(1H,3H)-dione (19). A solution of compound 1 a ( $30 \mathrm{mg}, 0.11 \mathrm{mmol}$ ), triphenylphosphine ( $118 \mathrm{mg}, 0.45 \mathrm{mmol}$ ), and benzoic acid ( 55 $\mathrm{mg}, 0.45 \mathrm{mmol}$ ) in a mixture of dry benzene/acetonitrile ( $5: 1,2.5$ mL ) was stirred at $0{ }^{\circ} \mathrm{C}$ under an argon atmosphere. Diethyl azodicarboxylate (DEAD, $71 \mu \mathrm{~L}, 0.45 \mathrm{mmol}$ ) was added dropwise during 1 min , the ice bath was removed, and the mixture was stirred at RT for 12 h . The solvent was evaporated to dryness, and the residue was purified by column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}, 20: 1\right)$ to provide a white solid still contaminated with $\mathrm{Ph}_{3} \mathrm{P}$. The solid was dissolved in a solution of $\mathrm{NH}_{3}$ in $\mathrm{MeOH}(7 \mathrm{M}, 2 \mathrm{~mL})$ in a sealed flask and stirred for 48 h at RT. Then, the mixture was concentrated under reduced pressure and purified by column chromatography (slow gradient of $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}, 40: 1 \rightarrow 30: 1 \rightarrow 20: 1 \rightarrow 15: 1 \rightarrow 10: 1\right)$ to provide the substitution product $2(11 \mathrm{mg}, 4.1 \mu \mathrm{~mol}, 37 \%$ overall yield) as a white solid and the elimination product $19(5 \mathrm{mg}, 2.0$ $\mu \mathrm{mol}, 18 \%$ overall yield) as a white solid.

General Procedure for the CuAAC under MW Irradiation. To a solution of azide 26 in a $1: 1$ mixture of water and $t-\mathrm{BuOH}(10 \mathrm{~mL} /$ mmol ) in a glass vial equipped with a magnetic stirring bar, copper powder ( $80 \mathrm{~mol} \%$ ), a 1 M solution of copper sulfate in water $(20 \mathrm{~mol}$ $\%$ ), and finally the alkyne ( 1.05 eq ) were added. The vial was sealed with a Teflon crimp top, and the reaction mixture was irradiated under MW at $125^{\circ} \mathrm{C}$. Upon completion of the reaction, the vial was cooled to $50{ }^{\circ} \mathrm{C}$ by air jet cooling before opening. The mixture was filtered over a plug of Celite (rinsed with MeOH ), and the filtrate was evaporated under reduced pressure.
