Paradigms as triggers of semantic change: Demonstrative adverbs in Catalan and Spanish*

Abstract

This paper sets out to analyse the development of demonstrative adverbs of place in Catalan and Spanish. The main questions dealt with in this study are the following: (i) why two-term and three-term deictic systems often display a certain lack of stability so that diachronically two-term systems sometimes become three-term (as in old Catalan and Spanish) or, the other way round, three-term systems become two-term (like in late Latin and in Catalan during the modern era); (ii) if the most normal and expected development is for deictic systems to take on anaphoric values, why in the case of the adverb aquí (‘near the speaker and/or addressee’) in Catalan and the adverb ahí (‘near the addressee’) in Spanish the opposite process happens; (iii) what role is played in these changes by the functional and formal relations set up within the paradigms of nominal and adverbial demonstratives in each language.

Keywords: spatial deictic systems; adverbial demonstratives; anaphora; grammaticalisation, paradigm relationships.

Resum. El paradigma com a motor del canvi semàntic: els adverbis demostratius en català i castellà

L’objectiu d’aquest article és analitzar l’evolució dels adverbis demostratius de lloc del català i l’espanyol. Les principals preguntes que es plantegen en aquest treball són les següents: (i) per què els sistemes dìctics binaris i ternaris mostren sovint una certa inestabilitat i diacrònicament els sistemes binaris es converteixen a vegades en ternaris (com s’esdevingué en el català i l’espanyol antics) o, a l’inverse, els ternaris passen a ser binaris (com en el llatí tardà i en el català durant l’edat moderna); (ii) si allò és més habitual i esperable és que els díctics assumeixin valors anafòrics, per què en el cas de l’adverbi aquí del català i l’adverbi ahí de l’espanyol es produeix el procés invers; (iii) quin paper juguen en aquests canvis les relacions funcionals i formals que s’estableixen dins els paradigmes de demostratius normals i adverbials de cada llengua.

Paraules clau: sistemes díctics espacials; demostratius adverbials; anàfora; gramaticalització, relacions paradigmàtiques.

* This study has been carried out as part of a research project supported by the Spanish Ministry of Economy and Competitiveness “Gramàtica del Català Modern (1601-1834)” (MINECO, Ref. FFI2012-37103) and by the Institut d’Estudis Catalans “Constitució d’un corpus textual per a una gramàtica del català modern” (Gem; PR2015-S04-MARTINES). I thank Maria Josep Cuenca, José Ignacio Hualde, Josep Ribera and Gemma Rigau for fruitful discussions on several aspects dealt with this paper.
1. Introduction

The formation and development of demonstrative adverbs of place in Catalan and Spanish gave rise to a series of questions that are especially significant for a theory of linguistic change in general and of space deixis systems in particular. The aim of this paper is to analyse these topics in Catalan and compare the results with the development in Spanish within a Romance framework. In this paper, I also want to highlight the importance of paradigmatic relations, as triggers of semantic change and as a mechanism that can explain cases that, at least on the surface of it, threaten the unidirectionality of grammaticalisation processes.

Space deictics are referential expressions that allow places to be described (1a) or entities to be located (1b,c) in relation to the position occupied by the interlocutors of the speech-act. From a category point of view, a distinction is usually made between adverbal demonstratives, which function as locative adjuncts or complements (1a), and nominal demonstratives, which can function either as determiners (1b) or as neutral pronouns (1c) in languages like Catalan and Spanish.1

(1)  a. Deixa les sabates aquí (Catalan) / Deja los zapatos aquí (Spanish)
     ‘Leave the shoes here’

   b. Posa’t aquestes sabates (Catalan) / Ponte estos zapatos (Spanish)
     ‘Wear these shoes’

   c. Posa’t això (Catalan) / Ponte esto (Spanish)
     ‘Wear this’

The most widely used localisation parameter has to do with the proximity or distance from the place of utterance. It is usual that languages establish at least a two-way distinction, with two degrees of distance (proximal and distal), like English, which has two nominal demonstratives (this/that) and two parallel adverbs

1. Verbs of the type ‘go’ and ‘came’, also have a deictic meaning, which indicate movement in relation to the space occupied by the interlocutors. See Fillmore (1966) for the deictic meaning of these verbs in English, and Rigau (1976) and Cifuentes (2007) for the parallel verbs in Catalan and Spanish, respectively. On the category of demonstratives, see also Anderson & Keenan (1985: 279-280) and Dixon (2003).
(here/there). Also common are languages that present a three-way distinction, with three degrees (proximal, medial and distal), like Latin, which has three nominal demonstratives (hic/iste/ille) and different series of three parallel adverbial demonstratives (hic/istēc/illēc, hāc/istāc/illāc, etc.). Although it is not a universal property (Dixon 2003: 79-85), space deictics can also be used with an anaphoric function, and some nominal or adverbial demonstratives only have this function. The Spanish adverb ahí, for example, has a deictic function in (2a), where it denotes the place occupied by the addressee, and an anaphoric function in (2b), where it has Madrid as antecedent. Plus, the Catalan clitic hi has a purely anaphoric function, as shown in example (2c), where it has Barcelona as antecedent.

(2) a. Quédate ahí.
   ‘Stay there’

b. Fueron primero a Madrid y de ahí a Cuenca. (ahí = ‘Madrid’) 
   ‘They went first to Madrid and from there to Cuenca’

c. A Barcelona, fa temps que no hi anem. (hi = ‘Barcelona’)
   ‘We haven’t been to Barcelona for a while’

The same as with other locatives items, adverbial demonstratives usually acquire more abstract temporal or notional values. For example, the Catalan adverb aquí ‘here’ has a temporal meaning in the construction d’aquí (a)… ‘in x time’ (3a) and a notional meaning in the consecutive constructions d’aquí que... ‘hence’ (3b).

(3) a. Tornarem d’aquí un moment
   ‘We’ll be back in a moment’

b. D’aquí que no ens digués res més
   ‘Hence, he didn’t tell us anything else’

2. Paradoxes and theoretical problems in the evolution of demonstratives

The development of demonstratives from Latin to the Romance languages of the Iberian peninsula poses a series of paradoxes and theoretical problems that are described below and that I shall attempt to address in this paper.

a) The first and most obvious question is related to the instability of two-term and three-term deixis systems. Table 1 shows the evolution of nominal demonstratives

2. In fact, corpus analysis shows that demonstratives frequently assume an anaphoric meaning. See Ribera & Cuenca (2013) and Cuenca & Ribera (2013) for a contrastive approach to demonstratives in fiction (English-Catalan, and English-Spanish, respectively).

from Latin to Spanish based on the masculine singular forms (and the masculine singular nominative in Latin). As the table shows, the Latin three-term system was reduced to a two-term system in Late Latin, due to the disappearance of the first degree demonstrative (*hīc*) and the semantic change of the second degree demonstrative (*iste*), which took on its value. At this stage, the demonstratives were usually reinforced by the deictic particle *ecce* or the later *eccu*, adopted in the Spanish reinforced forms (*aquel*, and in Old Spanish *aqueste* and *aquesse* that alternate with the simple forms *este* and *esse* respectively). Later on, the three-way system was reconstructed in Old Spanish by means of a form derived from the Latin demonstrative *ipse* (*esse* or *aquesse*, modern *ese*), which initially had identifying and emphatic value (Pieroni 2010: § 3.5) and was used afterwards as a medial demonstrative. This three-term system has persisted to the present day in Peninsular Spanish, although some varieties of American Spanish seem be moving to a new two-way contrast.

The development of Spanish is also shared by Portuguese and initially by Catalan. However, unlike Portuguese and Peninsular Spanish, in most Catalan varieties, a further reduction took place at a later stage and a two-way system

Table 2. Development of the system of nominal demonstratives from Latin to Catalan

5. It was reconstructed in the languages of the Iberian peninsula and partly from Occitan. Old Italian also has a three-term system and so does today’s Tuscan (Renzi & Vanelli 1995: 271, Vanelli 2010: 1248-1249).
6. This is the case of Argentinian Spanish and other varieties, in which the first degree is expressed by *este*, and the second either by *esse* or *aquel*. In this varieties the difference between *esse* and *aquel* is not one of distance but of register or genre, *aquel* being more formal and more contrastive than *esse*, but certainly not more distant. This recent development in American Spanish is not analysed in detail in this paper. On this subject, see Kany (1976: 320), Sedano (2003), RAE-ASAEL (2009: § 17.2n), Guzmán & Sáez (in press).
has been adopted. As shown in table 2, in this new two-way system only the reinforced form *aquest* is kept to express the first degree, but not the parallel simple form *est*.\(^7\)

The particular development of Catalan is even more surprising considering, as we shall see later on, that in this language the three-term system was documented much earlier than in Spanish and Portuguese.

\(b\) The cyclical nature of the change shown in table 2 is not the only paradox in the development of Catalan. With the exception of Catalan, in all Romance languages, the place of the speaker (or near to it) and the place of the addressee (or near to it) can be distinguished by means of demonstratives. As is the case with English, in languages with a two-term system the distinction is established, respectively, by means of the proximal and distal demonstratives, as can be seen from the examples with demonstrative adverbs in (4).

(4) a. Put your shoes *here*; do not leave them *there* (English)
   b. Metti le scarpe *qui*, non lasciarle *li* (Italian)
   c. Pune pantofii *aici*; nu lasă-*i aco*lo (Rumanian)

Likewise, in languages and dialects with a three-term system, the opposition is set up by means of the proximal and medial demonstratives, respectively, as shown in the examples with demonstrative adverbs in (5).\(^8\)

(5) a. Pon los zapatos *aquí*; no los dejes *ahí* (Spanish)
   b. Põe os sapatos *aqui*; não os deixes *ai* (Portuguese)
   c. Metti le scarpe *chi*; un lascialle *costì* (Tuscan)
   d. Posa les sabates *aci*; no les deixes *ahí* (Catalan from Valencia)
   e. Mets les chaussures *ici*, ne les laisse pas *là* (French)

It is only in Catalan that this distinction cannot be established by means of demonstratives, as shown in (6), where the demonstrative adverb *aquí* is used in both cases.

(6) Posa les sabates *aquí*; no les deixis *aquí* (Catalan)

In English and in all Romance languages, with the exception of Catalan, the first degree describes the speaker’s deictic space (the place that the speaker occu-

---

7. The three-term system has been preserved in varieties of Catalan spoken in Valencia and Aragon with the following nominal demonstratives: *est(e) / eix(e) / aquell*.

8. The third degree in Spanish uses the adverb *allí* (or *allá*), in Portuguese *ali*, in the Catalan used in Valencia *allí* (or *allá*), in Tuscan *ali* (or *là*) and in French *là-bas*. 
pies or near to it) and the other or the other two degrees are defined by negation of it. According to this, in two-term system languages, the second degree indicates distance from the speaker and can therefore denote the addressee’s deictic space (the place that the addressee occupies or near to it), as shown in figure 1.

In three-term system languages, the intermediate degree expresses proximity but excludes the place of the speaker, that is, it indicates medial proximity, which is frequently associated with the addressee’s deictic space. The third degree is defined negatively in respect of the second and indicates distance both from the speaker and from the addressee, as shown in figure 2.

Only in Catalan does the first degree refer to the deictic place of both the speaker and the addressee, and the second degree, which is negatively defined, indicates distance in relation to both, as shown in figure 3.

---

**Figure 1.** More usual two-term deictic system.

**Figure 2.** Three-term deictic system in Romance languages.

---

9. For some authors the second degree of the three-term system is identified with the addressee’s deictic space, as opposed to the first degree, which describes the speaker’s space (Bello 1847: § 254, Vanelli & Renzi (1995: § 2.2.3), Wheeler et al 1999: § 6.2-3). Others, on the other hand, argue that it describes an intermediate space between the nearness of the place occupied by the speaker and the distance (Hottenroth 1982; Anderson & Keenan 1985: 282; Eguren 1999: § 14.3.2.1; Brucart 2002: § 7.4.2). In this paper we take the latter perspective, but with a clarification put forward by Saragossà (2004: § 3.2.1), which is historically relevant: the fact that the second degree indicates proximity, like the first, but with the difference that it excludes the speaker and is therefore frequently associated with the addressee’s space.
c) The development of the deictic systems in Romance languages gives rise to a third paradox related to the supposed unidirectionality of grammaticalisation processes. Lexemes or constructions that are grammaticalised take on a grammatical value, or a higher grammatical value than they had at first. This usually occurs in conjunction with other changes, specifically in conjunctions with a greater syntactic fixation, an increased frequency of use, a more abstract and subjective meaning and, in certain cases, a phonetic erosion.10

One of the classic examples of the processes of grammaticalisation and unidirectionality of change is the development of the Romance article based on the third degree nominal demonstrative (7a). In this case grammaticalisation is translated: (i) semantically in the step from a deictic value to a more grammatical anaphoric or identifying value, (ii) syntactically in fixation in the prenominal position, and (iii) formally in a strong phonological erosion associated with the cliticisation process. The same change from a deictic meaning to an anaphoric one, and to a greater syntactic fixation and formal erosion can be seen in the Romance languages with the formation of third person pronominal clitics based on Latin demonstratives. These clitics usually derive from the distal demonstrative (7b-d), but also from the proximal demonstrative in the case of the Catalan neutral pronoun ho (7e).

(7) a. ILLUM ‘that-accusative-masculine-singular’ > él:o > elo > el (Spanish) / lo > el, l’ (Catalan) ‘the’
   b. ILLUM ‘that-accusative-masculine-singular’ > él:o > elo > lo (Spanish) / lo > el, lo, l’, l’ (Catalan) ‘him’
   c. ILLAM ‘that-accusative-feminine-singular’ > él:a > ela > la (Spanish) / la, l’ (Catalan) ‘her’
   d. ILLI ‘that-genitive-singular’ > él:i > eli > le (Spanish) / li (Catalan) ‘to him/her’
   e. HOC ‘this-accusative-neuter-singular’ > ho (Catalan) ‘it’

The development of the system of demonstratives from Latin to Romance languages of the Iberian peninsula produced, at least apparently, a counter-example

---

to the unidirectionality of the processes of grammaticalisation. 11 In fact, in the case of demonstratives that take on intermediate degree value (for example *ese* and *ahí* in Spanish) the change goes from an identifying and anaphoric value to deixis, and in the case of *ahí* it also involves an increase in phonological content:

(8) a. ipsum (‘self’, ‘((s)he/it) self’) > ese ‘that’
    b. ibī (‘the aforementioned place’) > hi > ahí ‘there’

3. The restructuring of the system of demonstrative adverbs from Latin

Latin displays a rich system of demonstrative adverbs which, in addition to the deictic or anaphoric distinctions associated with the root, enabled the expression of a number of spatial notions signalled by endings, as can be seen in table 3. 12

The spatial notions associated with the endings blurred with the evolution from Latin to Romance and finally became expressed by the presence or absence of locative prepositions. 13 As a result, some of the series eventually disappeared or changed their initial meaning. Spanish and Catalan have kept no adverbs derived from the series in -ūc/-ō, and those derived from the series in -īnc/-inde eventually disappeared, with the exception of the clitic *en* in Catalan (*inde* > *ne* > *en*, *ne*, *n’, ‘n*), which preserves its original meaning (*En vine ‘I come from there’) but has also taken on other values related to the preposition *de* ‘from, of’ (partitive, genitive, etc.). Both languages have retained forms that derive from the series in -ī(c) and -ā(c). In Spanish, the adverbs in -ī (*aquí*, *ahí* and *allí*) refer to more specific and objective locations, or locations conceived as points; similarly, the adverbs in -ā (*acá* and *allá*) refer to more vague and subjective locations, or locations conceived as areas (Carbonero 1979: 73-76; Hottenroth 1982: 135; Sedano 1994, 2000, 2001; Eguren 1999: § 14.4.2.1; RAE-ASALE 2009: § 17.8f; Maldonado 2013). 14 The same holds for Catalan, but the distinction is much less sharp, with the opposition between adverbs in -ī and in -ā only being kept in adverbs that indicate distance (*allí* and

11. This anomaly is referred to explicitly in the grammar of the RAE-ASALE (2009 § 17.2.ñ) when it explains the semantic change undergone by the Latin demonstrative *ipse* from the identifying value to the second degree deictic in peninsular Romance languages, saying: “constituye un proceso más anómalo desde el punto de vista tipológico que el contrario (es decir, la pérdida del valor deíctico de los demostrativos)”.

12. See Ernout (1953: § 106, 139), Monteil, (1992: 276-278) and Bassols (1956: § 162) and others.

13. Like in English and in many other languages (Dixon 2003: 70), the locative and the goal are expressed without preposition, and it is the verb that enables an understanding of whether the adverb indicates location (*Vive allí ‘(s)he lives there’) or goal (*Irá allí ‘(s)he will go there’). The other values, however, are expressed by means of the adverb preceded by a preposition, as in this case the same verb can be combined with different expressions of place: *Vino {desde/por} allí (‘(s) he comes {from/through} there’).

14. Most authors describe the opposition in terms of specific/vague locations (i. e. points and areas). However, in an interesting paper on the opposition between *aquí* and *acá*, Maldonado (2013) considers that this difference is derived from a more basic one based on degrees of “objectivity”. From this point of view, *aquí* involves a medium degree of subjectivity or quasi-objectivity that marks nearby areas and *acá* involves a close nearness that determines a greater degree of subjectivity.
allà), but not in the entire linguistic domain, as allí is used purely for literary purposes in some areas (Pérez Saldanya & Rigau 2011).15

This study focuses basically on the derivatives of Latin adverbs in -ī(c), as they are the only ones that reconstruct the two-way system of Late Latin in a new three-way system.16 As with nominal demonstratives, adverbial demonstratives also experienced a simplification of the deictic system in Late Latin, which entailed the loss of second degree adverbs (istīc, istāc, etc.). This two-term system was initially retained in both Spanish and Catalan, with Old Spanish having a simpler system than Old Catalan. As shown in table 4, the system in Old Spanish was reduced down to three adverbs: two deictic (aquí and allí) and one anaphoric (y, also spelled hi, which would later give rise to ahi). The first degree adverb comes from the Latin first degree adverb with the reinforcement ECCU, whereas the other two forms come from the corresponding Latin adverbs.

The system of Old Catalan was more complex, as it includes five adverbs distributed in a full (or stressed) series plus another clitic (or unstressed) series. Three of these forms derive from the Latin first degree adverb (hic), one without reinforcement (hic), one with the reinforcement ECCE (aci) and a third one with the reinforcement ECCU (aquí).17

15. The same difference is found in Italian, which presents two parallel series of adverbs: qui and lì, on the one hand, and quaù and là, on the other (Vannelli & Renzi 1995: § 2.2.2).
16. The fact that the three-way system was reconstructed in the -[i] adverbs and not in the -[a] adverbs is related to the meaning of each series and, specifically, with the fact that the three-way distinction is easier in those adverbs that refer to more specific locations, than in adverbs expressing more vague and subjective locations.
17. On this point Catalan is presented as a bridging language between Gallo-Romance and Iberian Romance languages: like those ones, they present forms derived from adverbs with the oldest reinforcement ECCE, and like these ones, they also have forms derived from adverbs with the latest reinforcement ECCU.

4. The formation of the three-term system in Catalan

Apart from the clitic *hic* in Catalan, which fell into disuse early on, the main difference between Old Catalan and Old Spanish has to do with the existence of a full adverb in Catalan (*aquí*) functionally parallel to the clitic *hi* (or *en* depending on the spatial notion). This difference can explain why the three-way deixis system could be reconstructed earlier in Catalan than in Spanish. In all medieval texts, *aquí* is documented mainly with an anaphoric function, which, as shown in table 5, seems to be the original one. This is the case in (9), where *aquí* is used twice, in both cases preceded by a locative phrase that functions as antecedent.

(9) *dix que menà los àsens a casa d’en Berenguer Dalmau e lexà’ls aquí; e la dona d’en Berenguer Dalmau donà-li del vin de la companya e begé més de ·IV· taces, e enaprès anà-se’n a la taverna d’en Tamarit, e begé aquí de vin […] e enbriagà’s (Clams: 122).

‘he said that he took the donkeys to Berenguer Dalmau’s house and left them there, and Berenguer Dalmau’s wife gave him wine from the company and he drank more than four glasses and then he went to Tamarit’s tavern, and drank wine there and got drunk’

As indicated above, in this anaphoric function, *aquí* coincides, therefore, with the clitic adverbs *hi* and *en*. However, its tonic nature makes it the most emphatic option from a communicative point of view. In (10), for example, the three adverbs have the same locative phrase as antecedent (*la nostra posada*), but *aquí* is used in the sentence in which the place mentioned is most relevant: the one indicating that Infante Pere has had to stay overnight in the besieged inn.

(10) *totes les gents de la villa de Murvedre se van abocar entorn la nostra posada ab armes, per manera que null hom no·n podia exir que no·n fos per ells reconegut qui era; axí que·l infant En Pere, qui y fó vengut, no·n poch exir, ans hagué aquí a romandre a jaure (Epistolari: 92-93).

‘All the people from the town of Morvedre arranged themselves around our inn with weapons, so that nobody could leave there without being recognised; so the Infante Don Pedro, who had gone there, could not leave there, but had to stay there to sleep’

Together with this anaphoric function, the adverb *aquí* was soon documented with a deictic value related to the place occupied by the addressee, or a space close to the speaker that could be used to refer to the space of the addressee as well in the event that the addressee was close to the speaker. The first examples that I have

---

18. The adverb *en* has the value of source, and the adverb *hi*, the other spatial notions (location, goal, path).
19. The distinction would therefore be similar to the one set up between the use of stressed or clitic personal pronouns in the cases where they alternated in the old language; for example, *dix això a ell* ‘he said that to him’ (with the stressed *ell*) compared to *dix-li això* ‘he told him that’ (with the unstressed *li*). Or in today’s language between the use of double clitics with a stressed pronoun or on their own: *Li va dir això a ell* ‘he said that to him’ compared to *Li va dir això* ‘he told him that’.
documented of this deictic use date back to texts from the second half of the 13th century or the first half of the 14th century. In these examples the deictic value is strongly linked to the situational context and to the type of speech-act, as shown in (11). In (11a) aquí seems to refer the space of the hearer, excluding the speaker. In (11b-c), aquí denotes a space close the speaker that is occupied by the addressee.

(11) a. e sobre azò él vi ·I· ome e dix-li:
—«[Qui] està •aquí•?».
E anc aquel om no sonà mot, e él dix-li altra vegada:
—«Qui està •aquí•?». (Alcoi: 24)
‘and he saw a man and said to him: «Who’s there?» and the man gave no answer, and he said again: «Who’s there?»’

b. E, entre aquestes paraules, él s’adormí. E vesec Sent Marc qui li vénc e·s pausà costa lo seu lít, e ausí ·I· vou, a él dient: —Què fas •aquí•, March? (Vides: 422)
‘And, with these words, he fell asleep. And he saw that St Mark came to him and stood next to his bed, and he heard a voice that said to him, «what are you doing (t)here Mark?»’

c. E quant la sancta ayçò viu, levà’s, e ab cara irada e ab grans critz li dix: «Ix d’él, mesquín, ix-ne!» E·l demoni li respòs: «E, si d’él isc, un entraré?» E per aventura avia •aquí• ·I• porquet, qui paxia aquí. «Ix d’•aquí•», dix la sancta, «e entra en aquest porc!» E aytan tost desemparà l’ome, e entrà en lo porc, e aucís-lo, e anà-sse’n. (Diàlegs: 49v)
‘And when the saint saw this, she got up and with an angry face and loud shouts she said to him «Leave him, wretch, leave! ». And the devil replied «And if I leave him, where shall I go?». And it so happened that there was a piglet there, grazing. «Get out of (t)here!» said the saint, “and enter that pig!». And straightaway it left the man and entered the pig, and he killed it and it went away’

The above examples are probably contextual deictic uses, similar to those that can be taken on by other anaphoric elements in contexts where the addressee is being questioned or asked something. This is what happens, for instance, in today’s Catalan with the anaphoric clitic hi in cases like the one in (12a), with the clitic referring to a box held by the addressee, or the example in (12b), with the clitic referring to a document that the addressee is reading. Likewise in (12c), where the clitic is in

correlation with the deictic aquí (‘proximal’ to the speaker or addressee in modern Catalan) and it denotes the place of the addressee or a space including it.  

(12) a. Què hi vols posar?  
   ‘What do you want to put there?’  

b. Què hi diu?  
   ‘What does that say?’ (lit. ‘What there says’)  

c. Què hi fas, aquí?  
   ‘What are you doing there?’  

Therefore, the fact that in Old Catalan the anaphoric adverb aquí can take on this type of contextual deictic values is not surprising. But it is surprising that these values eventually become lexicalised and produce a change that goes from anaphora to deixis. A factor that favours this fixation is the parallelism between space deixis and person deixis, and more specifically the fact that each space deictic is associated with one of the three grammatical persons. However, more specific factors must be added to this general factor in order to explain why the three-term deixis has not been reconstructed in all Romance languages. To account for these differences, paradigmatic relationships should be taken into account, and in particular, the analogical pressure that other elements in the adverbial demonstrative paradigm can exert to a specific anaphoric form within each language. As table 6 shows, at first aquí was linked to hi (and en) by their anaphoric function, but also with ací and allí, for their morphological structure and their syntactic distribution.

This formal and distributional proximity with both ací and allí, together with the fact that these two deictic adverbs also had anaphoric values, undoubtedly contributed to the contextual deictic values of aquí becoming fixed quite quickly. As table 7 shows, in this new system, aquí keeps its initial anaphoric function but incorporates the deictic meaning of medial distance, i.e. the possibility of denoting...
the space of the addressee as opposed to the space of the speaker. This deictic use emerges in emphatic contexts, where the addressee’s space needs to be differentiated from that of the speaker and so it connects perfectly with the emphatic nature of aquí in respect of the anaphoric variant hi.

In 14th century texts, the deictic value of aquí seems to have become fully conventionalised already. Clear signs of this fixation are the relative frequency with which it is documented and the fact that in quite a few cases aquí contrasts with the first degree adverb ací, both in dialogues (13a), and in epistolary texts, in which ací denotes the place of the letter writer and aquí the place of the person the letter is being sent to (13b,c).

b. Ffas-vos saber, senyor, que lo senyor rey vos tramet aquí dues galees per trametre a mi ací en Barchinona aquelles ·VII· mille lliures barchinoneses (Reintegració: 169) ‘I assure you, sir, that the King sent you there two galleys to bring (me) here to Barcelona those seven thousand pounds’

c. E açò comanam als desús dits, e a vós ab ells ensemes, per ço com vosal-tres, qui aquí sots, veets e conexets mils què se’n deu fer e què n’és pus expedient als afers, que no fem nós ací. (Epistolari: 172) ‘And we arranged this with the aforementioned and with you at the same time, for you who are there. You see and know better what has to be done and what is more suitable for business, than we can here’
A third sign of the fixations of the deictic value is the fact that *aquí* is used not only to express the addressee’s deictic space but also to indicate the medial proximity to the speaker, as shown in the two appearances of *aquí* in (14) respectively.

(14) Axiu d’équy, que veus *aquí* òmens, non ssé qí·s ssón! (*Cort*: 207)
‘Come out of there, there are men there, I don’t know who they are!’

If at first the deictic value is derived from a contextual use associated with the addressee, its use for expressing medial proximity to the speaker looks more like a semantic broadening, which suggests a greater degree of fixation of the deictic value.

5. The formation of the three-term system in Spanish

As indicated above (§ 3), the initial system of demonstrative adverbs in Spanish had just one anaphoric element (the adverb *y*). This can explain why the three-term system took a little longer to appear in Spanish than in Catalan. The adverb *y* could be used with a contextual deictic value, but its formal and functional differences compared to the deictic adverbs (*aquí* and *allí*) hindered this use from becoming conventionalised. Therefore, the reconstruction of the three-term system in Spanish required the previous appearance of the analogical variant *ahí* of the adverb *y*, with the initial *a* that is characteristic of various demonstratives, and formally links this adverb to the deictics *aquí* and *allí*, as shown in table 8. Note, on the other hand, that if *y* was initially a stressed form, the appearance of the disyllabic *ahí* brought on the loss of tonicity of *y*, which progressively became a clitic adverb.

The first documentary evidence of the analogical form *ahí* is found in 14th century texts or in copies from this period (Gutiérrez & Pascual 1995, Pascual 2010). As indicated in table 8, at first, *ahí* was used with the anaphoric value of *y*, as in (15), where it has *la plaça* (‘the square’) as antecedent.

(15) Abaxé más la palabra, díxel que en juego fablava / porque toda aquella gente de *la plaça* nos mirava; / desque vi que eran idos, que omne ay non fincava, / comencél dezir mi queuxura del amor que me afincava. (*Buen Amor*: 166)
‘I lowered my voice, I told him I was joking / because all those people in the square were looking at us; / when I saw they had gone, that nobody was left there / I started to tell him my amorous complaints’

Later the anaphoric value was joined by a deictic value related to the place of the addressee by means of a process similar to the one already described for the

22 Note that the adverb *y* in Spanish is halfway between the adverbs *hi* and *aquí* in Catalan. Just like this one *y* can function by occupying the position of an adjunct or function as a complement to a preposition, as shown by the following example: “non avié ý aún carrera fecha ninguna, ca nunca andudiera omne por ý” (*General Estoria*: 12) ‘They had not done any path there, because nobody had ever been there’. But it also displays symptoms of the start of the cliticisation process that will be consummated later.
adverb *aquí* in Catalan (see § 4). The first clear examples are found in works from the 15th century (Corominas & Pascual, 1980-1991: s.v *ahi*; Sánchez Lancis, 1990: 58-60, Terrado 1990; Company & Espinosa 2014: 177), a time when the deictic value seems to be fully conventionalised:23

(16) a. Dicho e fecho; el buen onbre sabyo tomó la anpolla e púsola en una ventana donde ella la viese. E luego dixo ella: “¿Qué pones *aí*, marido?” (Corbacho: 152)

‘Said and done; the good wise man took the bottle and put it in a window where she would see it. And then she said “What are you putting there, husband?”

b. —Vós non dezides verdad, que aquellos que vós dezides, e yo con ellos, somos *aquí* juntados por servicio del rey, e somos sus servidores, tanto como vosotros, esos que *aí* estades. (Victorial: 510)

‘You are not telling the truth, as those you talk about, and I with them, are here together at the king’s service, and we are his servants, as are you, who are there.’

d. MELIBEA. ¿Qué haces *aí* escondida, loca?

LUCRECIA. Llégate *aquí*, señora; oyrás a tus padres la priessa que traen por te casar. (Celestina: 303)

‘MELIBEA. What are doing hiding there, crazy woman?

LUCRECIA. Come here madam; you will hear how your parents are in a hurry to marry you off.’

Note also that, to the extent that *aí* is a reinforced variant of *y*, pushed the latter into disuse. As a consequence, there is a double change in the system, as the conventionalisation of the deictic value in the adverb *aí* runs parallel to the loss of vitality of *y*, which undergoes the process of cliticisation mentioned above that ends up with its morphological reanalysis in certain verbal forms (*hay* ‘there is’, *soy* ‘I am’, *voy* ‘I go’ and *estoy* ‘I am/stay’). According to Company & Espinosa (2014: 130-131, 198-199), this loss of vitality increased all the way through the 14th century, and became very prominent in the two first decades of the 15th century, although the adverb was still retained in some works until well into the 16th century.

---

23. Portuguese underwent a similar development to Spanish with the development of the adverb *aí*, which also came from the anaphoric *y* (Teyssier 1981).
century. So, unlike Catalan, the Spanish system was reduced to the full forms (*aquí*, *ahi* and *allí*) and has not maintained any specific anaphoric adverb.

6. More recent developments in Catalan

Once the three-term system had been reconstructed and the adverb *y* had disappeared, the Spanish system remained in place with no major changes up to the present day in Peninsular Spanish.24 On the contrary, a more complex development took place in Catalan, since, as has already been described in § 2, the three-term system has disappeared in most Catalan varieties, giving way to a two-term system in which *aquí* indicates proximity to the speaker and/or addressee and *allà* (or *allí*) expresses distance. This change is already well documented in 17th century texts, as shown in the examples in (17): in (17a) both *aquí* and *ací* refer to the speaker’s deictic space, and in (17b) *aquí* is used to refer deictically to the point in the text where the adverb appears.

(17) a. *aquí* ahont jo só, debaix de mi ý de mos peus, és lo acte; que dit Gelmar Bonsoms, notari, m’o à dit en lo infern, hont ell està. Desfeu estas rajolas que estan *assí*, que, des de la setena rajola fins a la dotzena de la paret, se trobarà lo manual. (*Viatge*: 236)

‘Here where I am, under me and my feet, is the document; that the aforementioned Gelmar Bonsoms, notary, told me in hell, where he is. Break these tiles that are here, as between the seventh and the twelfth tile in the wall the document will be found’

b. Y dire *aquí* una cosa la qual yo he considerada, y crec que molts la hauran advertida (*Geografia*: 245)

‘And I will say here something I have considered and that I think many will have already guessed’

In order to explain this restructuring of the system, both general factors and specific factors should be taken into account. The former are related to the nature of the deictic systems, independently of the forms of each specific language. The latter depend on the specificities of the demonstrative paradigm in Catalan.

6.1. General factors in the restructuring of the Catalan system

In terms of general factors, the possibility of using a second degree deictic (medial) with first degree value (proximal) can be favoured by the nature of space deictic items and three-way oppositions. Firstly, space deictics are opaque and elastic in nature. They are opaque because their mere utterance does not ensure that the referent can be identified (Eguren 1999: § 14.2.2), and they are semantically elastic because they can be used to describe more or less extensive places. This means

24. For the specificities of American Spanish varieties with a two-term deictic system, see footnote 25 below.
that a first degree adverb can denote the speaker’s space compared to that of the addressee (aquí donde estoy sentado ‘here, where I am sitting’), but also a wider place including them both (Aquí, donde estamos, hace mucho calor ‘Here, where we are, it’s very hot’).

In addition, in three-term systems, the opposition between the first degree and the second degree is objective if it is associated with the place occupied by the speaker and the addressee, respectively, but not if two degrees of proximity are expressed: immediate and medial, respectively (Eguren 1999: § 14.4.2; Brucart 2002: 1492-1493).

The two factors mentioned above can undoubtedly contribute to the loss of opposition between proximity (first degree) and medial proximity (second degree), and this explains the possibility that a deictic expressing medial proximity changes to indicate simple proximity. This change, in fact, does not only affect the demonstrative adverb aquí in Old Catalan. The nominal demonstrative iste (see § 2) underwent the same change in Late Latin and can be found today in certain uses of the French adverb là and of the determiner esse in Brazilian Portuguese. As for French, là keeps the value of intermediate distance in comparison to ici, but it is used in certain contexts with the value of the proximal demonstrative (18a).

Similarly, in Brazilian Portuguese, the second degree nominal demonstrative esse has colloquially displaced the first degree nominal demonstrative este, and is reinforced with aquí (‘here’) when reference is made to immediate proximity (18b).

(18) a. —Vous ne sortez pas? —Non, non, non, on bouge pas…, on reste là (Kleiber 1995: 13)
   ‘Are you not going out? No, no, no, we are not moving… we are staying here (lit. there)’

   b. Essa mesinha aquí ele recebeu de um amigo de Portugal (Jungbluth 2004-2005: 90)
   ‘This table here (lit. that table here), he received it from a friend in Portugal’

6.2. Specific factors in restructuring the Catalan system

The fact that the reduction of the system was favoured by the nature of the space deixis and three-term systems does not fully explain why this reduction took place in Catalan and not in Peninsular Spanish. To justify these differences, once again, the specific paradigmatic factors of Catalan need to be taken into account. As shown in table 9, at first, ací and aquí were formally linked with other demon-
strative determiners or pronouns. The adverb ací had a formal correlation with the other demonstratives that had arisen from the reinforcement ecce, namely, the determiners (ai)cest and (ai)cell, the deictic pronoun açò, the phoric pronoun çò and the adverb ça. The adverb aquí, on the other hand, was correlated with determiners with the reinforcement eccu: aquest, aqueix and aquell.

With later development, however, correlations changed. In the case of ací the correlations become weaker, as the determiners (ai)cell and (ai)cest, previously not very common, fell into disuse during the 14th century. The same happened with the adverb ça and with the pronoun çò a short time later (Casanova 2001). In the case of aquí, on the contrary, the relations became stronger. Although at first the determiners could have either simple forms or reinforced forms with aqu- in the two first degrees (aquest/est and aqueix/eix), the simple forms (est and eix) lost vitality from the end of the Middle Ages onwards across most of Catalan-speaking territory. Symptomatically they have not survived wherever aquí has been kept and the deictic system is two-term (Casanova 1993). By the end of the Middle Ages and especially in the Modern Age, aquí was better integrated in the systems of demonstratives, which is likely to have led to it gradually displacing ací and taking on the value of proximity both to the speaker (innovating value) and to the addressee (initial value). The resulting paradigm is shown in table 10.

This change in the deictic value also had repercussions on the purely anaphoric value of aquí, which was gradually abandoned as part of a process that had begun in the Middle Ages and that could already be seen in the second half of the 16th century. The purely anaphoric value was basically assumed by the adverb hi (or en if the locative complement indicates the source of the movement).

25. As pointed out above (see footnote 6), different varieties of American Spanish also show a tendency to reduce the three-term system to a two-term system (Sedano 2003; RAE-ASA 2009: § 17.8c; Di Tullio 2013: 335-336). In these varieties acá (or aquí) indicates proximity to the speaker and ahí signals distance (including proximity to the addressee) and becomes a variant of the more formal allí, which is also used for contrastive focus. This change is due to the general tendency to reduce three-term systems to two-term systems but it followed a different development than the one described for Catalan. The limitations of this study mean that this topic cannot be covered in detail. Suffice to say that once again, both general and specific factors played their part. In terms of general factors, the second and third degree are defined by negating the speaker’s deictic space and they therefore share this feature (see figure 2). In terms of specific factors, in American Spanish the binary adverb series ending in -á (acá and allá) shows a much greater vitality than in Peninsular Spanish, where acá is not commonly used (Sedano 2001: 55-56; Maldonado 2013: 321; RAE-ASA: 2009: § 17.8f). To conclude, note that ahí can be related formally with allí, via the palatal feature that shares the i of the former ([a.ii]) and the consonant l of the latter ([a.yí]), and this formal closeness might have favoured their semantic proximity.
7. Conclusions

As has been shown throughout this paper, the systems of space deixis frequently show a certain degree of instability and a tendency towards bidirectional restructuring. On the one hand, the evolution may be from a system of three-way opposition to a two-way one, as occurred in Late Latin and in most Catalan varieties in the Modern Age. On the other hand, the development may involve a change from a two-term to a three-term system, as occurred in Old Catalan, Old Spanish and Old Portuguese.

This two-way tendency is partly motivated by the very nature of deictic oppositions and by the opaque character of space deictics. The parallelism with personal pronouns favours a three-way distinction, in which the first degree is associated with the speaker’s deictic space and the second degree is associated with the addressee’s deictic space. Conversely, the fact that this objective distinction is not always pertinent, along with the possibility that the demonstratives express progressive degrees of distance, leads to the opposition becoming diluted in some cases. This may result in the demonstrative indicating medial proximity changing to indicate simple proximity.

In addition to factors related to the nature of space deictic systems, systems may be restructured depending on specific factors in each language, and, more particularly, on the paradigmatic relationships set up between the demonstrative forms of each language.

The change from two-term to three-term deixis documented in Old Catalan and Old Spanish can be explained by the possibility that anaphoric demonstratives can take on contextual deictic uses linked to the addressee’s space. This contextual meaning became conventionalised very early on in Catalan because the anaphoric adverb *aquí* was in formal and distributional parallel to the deictic adverbs *ací* and *allí* from the outset. In Spanish the process occurred a little later, as first the form *ahi* had to be analogically recreated from the demonstrative *y*.

The change from three-term to two-term deixis that occurred in Catalan in the Modern Age was again favoured by paradigmatic factors and, specifically, by the loss of vitality of certain formal variants, which left the first-degree adverb *ací* increasingly isolated and led to the strengthening of the second-degree adverb *aquí*. As a result of these correlation changes, *aquí* gradually displaced *ací* and took on the value of proximity both to the speaker and to the addressee.
