Funaria convexa Spruce and *F. pulchella* Philib. are two species that Crundwell & Nyholm (1974) related to *F. muhlenbergii* Turn. According to Fife (1985, 1996), the genus *Funaria* is restricted to species with capsules inclined, asymmetric and sulcate when dry, double peristome with strongly sigmoid teeth, which are fused at apices, and a compound and revoluble annulus; species with inclined and asymmetric but not sulcate capsules when dry, more or less sigmoid teeth not fused, and simple, non-revoluble annulus, like *E. muhlenbergii* (Tur.) Fife, belong to *Entosthodon* subg. *Plagiodus*. Consequently, the following new combinations are necessary.

***Entosthodon convexus* (Spruce) Brugués, comb. nov.**

Basionym: *Funaria convexa* Spruce, *Musc. Pyr.* 149, 1847.

***Entosthodon pulchellus* (Philib.) Brugués, comb. nov.**

Basionym: *Funaria pulchella* Philib., *Rev. Bryol.*: 11, 41. 1884.
