

**Quantitative Methods****2015/2016**

Code: 41984

ECTS Credits: 10

Degree	Type	Year	Semester
4311312 Management, Organization and Business Economics	OB	0	1

**Contact**

Name: Josep Rialp Criado

Email: Josep.Rialp@uab.cat

**Teachers**

Cecilio Mar Molinero

**Use of languages**

Principal working language: english (eng)

**External teachers**

Esterban Lafuente

**Prerequisites**

No specific preconditions although some general knowledge in statistics are more than welcome.

**Objectives and Contextualisation**

The module introduces multivariate methods for the quantitative analysis of large databases. It also includes methods for creating and improving measurement scales and for analysis of experimental and non-experimental data. The use of statistical packages is emphasized through exercises and applied works. The module also contains econometric methods including response models, discrete censored regression models, methods of sample selection and panel data models. Additionally, also addresses mathematical programming in the context of operational research.

**Skills**

- Analyse and summarise large amounts of complex quantitative and qualitative information using statistical, econometric and mathematical programming techniques.
- Develop a critical and a constructive attitude to one's work and that of others.
- Develop an ethical, social and environmental commitment.
- Explain and motivate the analyses, interpret the results and present all these clearly and concisely in English.
- Identify the relevant sources of information and their content for subsequent analysis.
- Leadership and decision-taking capability.
- Make use of quantitative documentary sources that are significant for the economic analysis of organisations from a critical perspective.
- Master the technical and IT tools needed to carry out applied studies.
- Present research results to various audiences using the different media available.
- Recognise the problems associated with the comparability of different organisational situations in empirical international research

- Understand qualitative models of the firm and interpret their results.
- Understand the application of theoretical models to real business problems.
- Work in multidisciplinary international teams.

## Learning outcomes

1. Choose the most appropriate theoretical model for the objectives set by the business situation under study.
2. Develop a critical and a constructive attitude to one's work and that of others.
3. Develop an ethical, social and environmental commitment.
4. Explain and motivate the analyses, interpret the results and present all these clearly and concisely in English.
5. Further investigate the differences between different organisational situations.
6. Identify the aspects that differentiate the theoretical models.
7. Identify the relevant sources of information and their content for subsequent analysis.
8. Identify the sources of data at international level.
9. Know and distinguish the characteristics of the different business databases.
10. Know different statistical, econometric and mathematical programming techniques.
11. Leadership and decision-taking capability.
12. Master the technical and IT tools needed to carry out applied studies.
13. Present research results to various audiences using the different media available.
14. Resolve the models of probability and statistics, econometrics and mathematical programming.
15. Select the most appropriate techniques to analyse both quantitative and qualitative information.
16. Show mastery of the analysis of experimental data and survey data.
17. Work in multidisciplinary international teams.

## Content

The module provides vital input into decision-making in business and management. In particular, the course provides an applied introduction to data analysis. The main purpose is to provide students with the basic knowledge for developing empirical analysis and understanding the results. The approach to the subject will be essentially practical, being STATA the statistical computer package used throughout the module.

The following topics will be covered:

1. Data management, graphics and applications.
2. Descriptive statistics. Significance. Plots. Hypotheses tests.
3. Normality tests. Parametric and non-parametric tests for comparison of means.
4. Analysis of cross-classifications.
5. Measures of association.
6. Correlation.
7. Regression.
8. Logistic regression.
9. Factor analysis. Cluster analysis and property fitting.
10. Structural Equation Models.
11. Discrete choice models.
12. Censored and truncated models.
13. Panel Data.

Further details are provided in the MMOBE web page.

## Methodology

The module presents a practical approach, therefore sessions are scheduled in computer rooms and developed through the use of statistical packages (STATA mainly, and also SPSS).

Generally, professors present different techniques (objectives and requirements related to the type of variables), they use the statistical packages and teach how they can be used in relation to the techniques previously commented, and finally they develop some exercises.

Other exercises and cases are assigned to the students.

## Activities

Title	Hours	ECTS	Learning outcomes
<b>Type: Directed</b>			
Lectures, discussions and case presentations	100	4	1, 5, 6, 8, 9, 10, 14, 15, 16
<b>Type: Supervised</b>			
Training and monitoring of work in progress and cases	15	0.6	1, 5, 6, 8, 9, 10, 14, 15, 16
<b>Type: Autonomous</b>			
Reading related cases and practical preparation, study and preparation of schemes	95	3.8	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17

## Evaluation

The system followed in the module considers 3 elements to assess the performance of the students:

1. Class participation.
2. Assignments.
3. Test.

## Evaluation activities

Title	Weighting	Hours	ECTS	Learning outcomes
Assignments	40%	30	1.2	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17
Class participation	5%	0	0	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17
Test	55%	10	0.4	1, 3, 4, 5, 6, 8, 9, 10, 12, 14, 15, 16
