

**Numeric Methods and Computer Applications**

Code: 100966  
ECTS Credits: 6

Degree	Type	Year	Semester
2500253 Biotechnology	FB	2	2

**Contact**

Name: Susana Serna Salichs  
Email: Susana.Serna@uab.cat

**Use of languages**

Principal working language: spanish (spa)  
Some groups entirely in English: No  
Some groups entirely in Catalan: No  
Some groups entirely in Spanish: Yes

**Prerequisites**

It is strongly recommended that the student has passed the following subjects: Mathematics and the contents of Computer Science of the course Integrated Laboratory 1.  
We understand that the students already know how to use calculators and computers.

**Objectives and Contextualisation**

In the Numerical Analysis course we will study computational algorithms to solve some of the basic problems that usually appear in the scientific calculation, such as the calculation of the solution of nonlinear equations, the resolution of systems of linear equations and the numerical resolution of differential equations.

The goal of the course is that the student learns about these methods from their mathematical foundation, studying the properties of convergence and stability and estimating errors and their applicability and possible limitations.

Computer laboratory sessions will have an important role in this course. The sessions are a complement to better understand the numerical methods. The computer lab sessions allow to show, in different examples, the properties of convergence and stability studied analytically in the seminars. The sessions will also help to compare different numerical methods to solve the same problem. Most examples will be considered at an easy level so they can be done by hand or with a calculator. Keep in mind that real problems are usually much more complicated and cannot be done without using a computer. It is in the later cases where the phenomena described in the theory seminars are produced.

The procedure we will follow consist of first, understand the methods studied in the seminars, then do a series of exercises by hand or with a calculator in order to master the algorithm and finally, codify the algorithm with which to solve more difficult problems. That is why the theory and problem seminars and the computer laboratory sessions have the same importance.

Capacities or skills to acquire.

- Understand the mathematical foundations of the methods.
- Ability to generate or build the different methods.
- Distinguish the different types of errors introduced by a method and understand how to estimate them.
- Understand convergence criteria for iterative methods.
- Learn how to compare different methods to solve the same problem.

- Ability to choose the most appropriate numerical method (s) to solve a given problem.
- Sufficient skills to implement these methods in the most efficient way.
- Give practical stopping iteration criteria in order to obtain a fixed accuracy.

Develop criteria to detect erroneous results and ability to find the source of errors (ill-conditioned problem, method not suitable for the problem considered, unstable numerical scheme, etc.) and correct them.

## Skills

- Make decisions.
- Reason in a critical manner
- Use ICT for communication, information searching, data processing and calculations.
- Use the fundamental principles of mathematics, physics and chemistry to understand, develop and evaluate a biotechnological process.

## Learning outcomes

1. Analyse the different types of errors and their importance in problem solving. Apply certain numerical methods for equation-solving and integration.
2. Interpret the graphs of functions of one or more variables and relate them to their formulae.
3. Make decisions.
4. Reason in a critical manner
5. Use ICT for communication, information searching, data processing and calculations.

## Content

### REVIEW OF BASIC KNOWLEDGE FOR THE COURSE

- Derivation and integration in several variables. Function graphic representation
- Taylor's formulas in one and several variables.

### 1. ERRORS

- Sources of error.
- Absolute error and relative error.
- Propagation of errors in the data and the calculations.
- Ill-conditioned problems

### 2. RESOLUTION OF NON-LINEAR EQUATIONS

- Methods of Bisection and fixed point. Secant and Newton's methods.
- Order of convergence
- Systems of nonlinear equations.

### 3. INTERPOLATION AND INTEGRATION OF FUNCTIONS

- Lagrange Formula and divided differences.
- The error in polynomial interpolation.

- Trapezoidal rule
- Simpson's rule
- The error in numerical integration.
- Composite formulas.

#### 4. DIFFERENTIAL EQUATIONS

- Introduction.
- Euler method.
- Taylor's method.
- Runge-Kutta Methods.
- Step adaptation techniques.
- Systems of differential equations.

#### 5. REGRESSION AND APPROXIMATION

- Overdetermined systems
- Approximation by minimum squares
- Approximation of functions dependent on two parameters.

### Methodology

This course consists of two hours per week for theory seminars and one for problems sessions.

In addition, within the course "Integrated laboratory 4 " there are five computer laboratory sessions related to the course throughout the semester of three hours each.

In theory seminars, several numerical methods will be introduced and their basic properties will be studied. The problems sessions will be devoted to the resolution of problems of a theoretical nature and / or problems requiring the use of a calculator to be solved. Lists of problems will be provided throughout the semester and will be available on the website of the virtual campus. It is essential to bring a calculator to these sessions.

Problems sessions will be intercalated within the usual schedule as the subjects are completed.

In the computer laboratory sessions the student will have to solve numerically certain problems with the help of the computer. These sessions will take place in the PC's laboratories of the faculty. The student will have a guide describing the steps to follow in each session which will consist of the implementation of some of the numerical methods studied and their use to solve the proposed problems.

### Activities

Title	Hours	ECTS	Learning outcomes
<b>Type: Directed</b>			
Theory and problems seminars	45	1.8	1, 5, 2, 3, 4
<b>Type: Supervised</b>			
Continuous evaluation	5	0.2	1, 5, 2, 3, 4

**Type: Autonomous**

---

Personal study and problem resolution	95	3.8	1, 5, 2, 3, 4
---------------------------------------	----	-----	---------------

---

**Evaluation**

During the semester there will be four partial tests. In these tests it will be necessary to solve problems related to the contents of the course. In most cases the use of a calculator will be necessary

Each test weights 25% of the final grade of the course. In order to pass the course it is necessary that the total average is equal to or greater than 5. There is no need to obtain a minimum mark in any of the partial tests in order to pass the course.

It will be considered that a student will obtain the non-appraising qualification if the number of assessment activities carried out is less than 50% of those programmed for the course

The competences to be achieved are not associated with any chapter of the specific agenda but to all of them and therefore, in the case of repeaters for years to come, the continuous evaluation process must be repeated. The computer laboratory sessions, which are part of the Integrated Laboratory 4 course, will be determined by what is described in that course.

**Evaluation activities**

Title	Weighting	Hours	ECTS	Learning outcomes
Partial 1	25%	1	0.04	1, 5, 2, 3, 4
Partial 2	25%	1	0.04	1, 5, 2, 3, 4
Partial 3	25%	1	0.04	1, 5, 2, 3, 4
Partial 4	25%	2	0.08	1, 5, 2, 3, 4

---
