

Radiation Physics

Code: 100186
ECTS Credits: 6

Degree	Type	Year	Semester
2500097 Physics	OT	4	2

Contact

Name: Carlos Domingo Miralles
Email: Carles.Domingo@uab.cat

Use of Languages

Principal working language: catalan (cat)
Some groups entirely in English: No
Some groups entirely in Catalan: No
Some groups entirely in Spanish: No

Other comments on languages

The teaching of the subject is done indistinctly in Catalan / Spanish

Teachers

Miguel Ángel Caballero Pacheco

External teachers

Immaculada Martínez Rovira

Prerequisites

It is recommended that, in addition to the general knowledge taught in the first cycle subjects, they have previous knowledge of the bases of atomic physics and nuclear physics.

Objectives and Contextualisation

- Differentiate the ionizing radiations of the non-ionizing ones
- Study the processes of nuclear disintegration, the law of radioactive activity and the series of radioactive decay
- To know the physical principles of the interaction of any type of ionizing radiation with matter
- Apply these physical principles to the detection of ionizing radiation
- Study and differentiate the different types of radiation detectors and electronics associated with detection.
- Have knowledge of the different fields of application of ionizing radiation: environment, medicine and industry.

- To know the physical, limiting and operational magnitudes in radiation protection and their relation to radiation-matter interaction.

Competences

- Apply fundamental principles to the qualitative and quantitative study of various specific areas in physics
- Be familiar with the bases of certain advanced topics, including current developments on the parameters of physics that one could subsequently develop more fully
- Carry out academic work independently using bibliography (especially in English), databases and through collaboration with other professionals
- Communicate complex information in an effective, clear and concise manner, either orally, in writing or through ICTs, and before both specialist and general publics
- Develop critical thinking and reasoning and know how to communicate effectively both in the first language(s) and others
- Develop independent learning strategies
- Formulate and address physical problems identifying the most relevant principles and using approximations, if necessary, to reach a solution that must be presented, specifying assumptions and approximations
- Generate innovative and competitive proposals for research and professional activities.
- Plan and perform, using appropriate methods, study, research or experimental measure and interpret and present the results.
- Respect the diversity and plurality of ideas, people and situations
- Use critical reasoning, show analytical skills, correctly use technical language and develop logical arguments
- Use mathematics to describe the physical world, selecting appropriate tools, building appropriate models, interpreting and comparing results critically with experimentation and observation
- Using appropriate methods, plan and carry out a study or theoretical research and interpret and present the results
- Work independently, have personal initiative and self-organisational skills in achieving results, in planning and in executing a project
- Working in groups, assume shared responsibilities and interact professionally and constructively with others, showing absolute respect for their rights.

Learning Outcomes

1. Analyse levels of radiation from a set of measurements obtained in a real installation.
2. Apply convolution techniques for obtaining the spectrum of neutron fields detected through spectrometer measurements.
3. Calculate approximately the suitable shielding for radiation protection in specific practical situations.
4. Combine information provided by several detectors to obtain information integrated from the radiation characteristics analysed.
5. Communicate complex information in an effective, clear and concise manner, either orally, in writing or through ICTs, in front of both specialist and general publics.
6. Demonstrate an understanding of the bases to radiation detectors used in imaging for diagnosis and medical treatment.
7. Demonstrate an understanding of the bases to the techniques and instruments of the production of ionizing radiation used in medicine, industry and research.
8. Describe the physical principles underlying the detection of ionizing radiation.
9. Determine the basic characteristics of, and carry out measurements for, alpha, beta and gamma radiation in the laboratory.
10. Determine the most suitable type of detector for each type of ionizing radiation.
11. Develop critical thinking and reasoning and communicate ideas effectively, both in the mother tongue and in other languages.
12. Develop independent learning strategies.
13. Generate innovative and competitive proposals for research and professional activities.

14. Obtain the Bethe-Bloch equation and apply it to the interaction of particles charged with matter.
15. Obtain the equations for the Compton effect, the Compton cross-section and absorption coefficients and attenuation, and apply these to the interaction of photons with matter.
16. Proceed to the calibration of different types of detectors based on results in metrological facilities.
17. Respect diversity in ideas, people and situations.
18. Solve differential equations associated to decay chains.
19. Use critical reasoning, show analytical skills, correctly use technical language and develop logical arguments
20. Use numerical simulation to calculate the transport of radiation through matter.
21. Work independently, take initiative itself, be able to organize to achieve results and to plan and execute a project.
22. Working in groups, assume shared responsibilities and interact professionally and constructively with others, showing absolute respect for their rights.
23. Carry out academic work independently using bibliography (especially in English), databases and through collaboration with other professionals

Content

1.- Introduction

Radioactivity, since 1890.

Atoms

Atomic structure and atomic radiation

Nuclei

The nucleus and the radioactivity. Disintegration diagrams. Alpha, beta and gamma radiation.

Radioactivity

Activity and law of radioactive decay. Disintegration series. Balance

2.- Radiation-matter interaction

Interaction of particles loaded with matter

Heavy particles: collision mechanisms. Primary and secondary ionization. Power of braking. Semiclassic treatment: Bethe-Bloch equation. Energies of excitement. Reach Radiation Cerenkov. Limitations of semiclassical treatment.

Electrons: Mechanisms of loss of energy: collisions and emission of braking radiation. Reach

Traces of charged particles: Delta rays. Loss of restricted energy. Linear energy transfer (LET). Specific ionization. Fluctuations in energy and range. Dispersion of multiple Coulomb.

Interaction of photons with matter.

Photoelectric effect. Compton effect. Pair production Photonuclear reactions. Dimension coefficients and absorption coefficients.

Neutrons.

Neutron sources. Neutron classification. Mechanisms of interaction with the subject. Elastic dispersion Reactions and power threshold. Activation Fission Criticism

3.- Radiation detectors

Account statistics

Statistical models. Uncertainty Limit detection

General properties of detectors

Modes of operation. Resolution in energy. Efficiency of detection. Dead time Resolution time

Gas detectors

Ionization chambers.

Proportional Counters: Multiplication. Operation of proportional counters. Efficiency of detection and counting curves.

Geiger-Müller Counters: Download. Temporary behavior Design particulars. Efficiency

Flashing detectors

Solid spark plugs Liquid spark plugs Fotomultipliers and photodiodes. Spectrometry. Response to gamma radiation and neutrons

Semiconductors

Si Diodes Ge detectors Other semiconductors. Avalanche detectors

Neutron detectors

Detection of slow neutrons. Detection and rapid neutron spectrometry. Detectors based on activation.

Other detectors

Photographic emulsions Thermoluminescent dosimeters. Trace Detectors. Detectors Cerenkov. Fog rooms. Bubble chambers

Nuclear electronics

Pulse processing Impedances Linear functions and logic functions. Digital devices Multi-channel analyzers

4.- Applications

Radioprotection

Dosimetry Magnitudes and units. Dose calculation. Biological effects of radiation. Radiation protection: external radiation and internal dosimetry

Industrial applications

Measures of thicknesses. Density measurements Level control. Quality control. Sterilization.

Medical applications

Diagnostic tests (TAC). Production of radiopharmaceuticals. PET Radiation therapy treatments: LINACs and hadron therapy.

Natural environment:

Use of tracers. Environmental protection Geochronology.

5.- Practices (provisionalist)

Computer tools in radiation physics (classroom)

Geiger-Müller counter: characteristic curve, resolution time and geometric factor.

Determination of detection efficiency

Detection of alpha particles with a semiconductor surface barrier detector.

Absorption and backscattering of beta radiation

Gamma Spectrometry with solid flashlight NaI (TI). Calibration in energy and study of spectra

Neutron spectrometry: the active system (^3He) and the passive system (activation of ^{197}Au) of the Bonner spheres of the UAB.

Methodology

The subject has face-to-face classes of theory, problems and laboratory practices. It is highly recommended to attend classes of theory and problems, and it is mandatory to assist and perform the laboratory practices.

During the course, the carrying out of supervised activities, both of a more theoretical nature (bibliographic research and work realization) and of a practical nature (problem solving and experimental data search) will be considered.

The student will have to devote an important part of the time in the extension of the knowledge given in class and in the personal study.

Activities

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Laboratory demonstrations	7	0.28	2, 4, 7, 6, 10, 9, 1, 16, 20
Problems solving at the classroom	12	0.48	2, 3, 4, 7, 6, 8, 12, 11, 10, 9, 1, 14, 15, 16, 18, 20
Theory lectures	30	1.2	2, 3, 4, 6, 8, 11, 10, 1, 14, 15, 18, 20
Type: Autonomous			
Bibliographic tasks and problems	15	0.6	5, 12, 11, 23, 13, 19, 17, 21, 22
Information reasearch and studying	61	2.44	5, 12, 11, 23, 13, 19, 17, 21, 22
Preparation of the demonstration's reports	16	0.64	5, 12, 11, 23, 13, 19, 17, 21, 22

Assessment

The evaluation of the subject will be carried out with four types of activities:

1.- Practical theoretical examinations: There will be two partial exams with questions and problems about the syllabus taught in class or that the student has worked throughout the course that have a global weight of 50%. The partial exams are carried out on the dates reserved for this activity in the calendar of the degree of physics. Each partial exam has a weight between 20% and 30% on the final grade. The repesca test, on the scheduled date for the physical fitness calendar, allows students who have not passed one or both of the partials to have a second chance to do so. The possibility is not for students that have passed the course to submit to the repesca test to upload the note.

2.- Control and continuous evaluation tests that will be carried out during the course. Because of its nature, repesca is not possible. Typically 3 tests are performed throughout the course. The overall weight of this activity is 20%.

3.- Evaluation of laboratory practices. Based on the corresponding reports and the evaluation carried out by the laboratory professors during the performance of the practices. The accomplishment of the practices is an indispensable requirement to surpass the subject. The weight of this activity is 20%.

4.- Evaluation of the directed work and problems. With a global weight on the 10% note.

In order to pass the course, it is mandatory to note all the activities that can be evaluated.

Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
Control tests during the course	20%	1	0.04	8, 12, 10, 14, 15
Evaluation of demonstrations and their reports	20%	0	0	2, 4, 7, 6, 12, 11, 9, 1, 13, 16, 19, 17, 21, 22, 20
Evaluation of supervises tasks and problems	10%	0	0	2, 3, 4, 5, 12, 11, 23, 1, 13, 19, 17, 20
Repesca: recovery of the two partial examinations	50%	3	0.12	2, 7, 6, 8, 12, 11, 10, 14, 15, 16, 18, 20
Two partial examinations: 1) Interaction of radiation with matter; 2) Radiation detectors and applications. Each part has a weight of between 20% and 30%	50%	5	0.2	2, 7, 6, 8, 12, 11, 10, 14, 15, 16, 18, 20
