

Environmental Energy and Resource Management

Code: 104528
ECTS Credits: 6

Degree	Type	Year	Semester
2503743 Management of Smart and Sustainable Cities	OB	1	2

Contact

Name: Yoon Hyerim

Email: Hyerim.Yoon@uab.cat

Use of Languages

Principal working language: spanish (spa)

Some groups entirely in English: No

Some groups entirely in Catalan: Yes

Some groups entirely in Spanish: Yes

Other comments on languages

Lessons will be in spanish and catalan.

Teachers

Yoon Hyerim

Xavier Font Segura

Prerequisites

As it is a first year course, it is not obligatory to have taken any course previously. In any case, in order to take this course, it is necessary:

- Written and oral communication skills;
- Intermediate level of Catalan, Spanish and English, which allows written and auditory comprehension in the three languages, and
- Intermediate level of office automation -MS Office or other free softwares - especially in managing spreadsheets, texts and presentations.

Objectives and Contextualisation

The objective of this subject is twofold. On the one hand, it aims to provide basic knowledge about the economic, social and territorial context in which the energy and resource management systems operate in advanced societies. On the other hand, it aims to enhance understanding on some of the tools that allow to evaluate the functioning of aforementioned systems. The two objectives are addressed by different thematic focus. The first objective is addressed by taking energy as thematic focus while the second objective takes resources as a thematic focus.

The subject introduces the effect of socio-economic and territorial elements in the energy and resource system with a high level of technical complexity. Thus, the configuration and evolution of these systems does not only

respond to a technical or technological component but more so conditioned by other issues such as diverse the legal and administrative framework, urban and territorial environment, business structure, geopolitic, global economy, consumption patterns and the demands of the population, and awareness of the society. The first part of the course, mainly focusing on energy, will be looking at these issues in detail. It will cover geographical and historical context, and different components of an energy system. Energy markets are explained from the description of the three major groups of agents: suppliers, consumers and the administration. Lastly, the course will describe some of the impacts of the current energy model on our society and will try to highlight some of the solutions proposed at the planning stage.

As for the second objective, to acquire a global vision of environmental management, it will provide students with fundamental concepts of sustainability and knowledge about the main tools of sustainability. The content of this course covers mainly topics of life cycle assessment and environmental risk assessment with practical examples based on environmental resource management.

Competences

- Analyse and model urban and regional dynamics using methodological instruments for qualitative and quantitative analysis.
- Carry out projects related to the management, equality and sustainability of cities applying elements of technological innovation such as ICT.
- Demonstrate creativity, initiative and sensitivity in the different social and environmental topic areas.
- Identify and analyse government and management policies for cities in the different fields of urban development, particularly methods of public participation.
- Identify and interpret social, economic, technological and sustainability challenges in different areas such as: town planning, infrastructures, mobility, urban economies, services and equipment, cultural diversity and social inequality, energy and natural resources, waste, etc.
- Measure the technological infrastructure necessary to respond to the needs of cities, understanding the interactions between technological, social and operational aspects of cities.
- Solve urban management problems using knowledge, methodology and procedures for the design and implementation of computer applications for different types of environment (web, mobile, cloud) and different paradigms.
- Students must be capable of collecting and interpreting relevant data (usually within their area of study) in order to make statements that reflect social, scientific or ethical relevant issues.
- Students must develop the necessary learning skills to undertake further training with a high degree of autonomy.

Learning Outcomes

1. Analyse and model processes in the field of energy, water cycle, control of atmospheric pollution and waste management, with special reference to the planning and management of those services and infrastructures necessary for this purpose.
2. Analyse urban environment from the perspective of the circular economy and sustainability.
3. Apply methods and techniques for treating environmental problems, of mobility and territorial planning.
4. Be aware of the main regulatory sources in the ambits of environmental management and mobility.
5. Demonstrate creativity, initiative and sensitivity in the different social and environmental topic areas.
6. Identify the fields of action and resources necessary to design business and community strategies in the ambit of environmental management.
7. Students must be capable of collecting and interpreting relevant data (usually within their area of study) in order to make statements that reflect social, scientific or ethical relevant issues.
8. Students must develop the necessary learning skills to undertake further training with a high degree of autonomy.
9. Understand and use environmental-assessment reports.
10. Understand tools of environmental analysis such as life-cycle or carbon footprint analysis, and use these at a basic level.
11. Use qualitative techniques for the study, modeling and planning of energy systems (generation, transport, distribution and consumption), mobility (infrastructure and flows) and territorial planning (urban planning and policies). The techniques mentioned include the elaboration and management of

structured, semi-structured and open surveys, participant observation, the study of group dynamics and the management of participation processes.

12. Use quantitative techniques for the study, modeling and planning of energy systems (generation, transport, distribution and consumption), mobility (infrastructure and flows) and territorial planning (urban planning and policies). The techniques mentioned include the use of cost-benefit analyses, monitoring, construction of transport network graphs, matrix calculation of mobility flows, preparation of planning reports and SWOT analysis.

Content

Block 1: Energy

- 1. Geographical context of energy
- 2. Historical context of energy
- 3. Energy systems: definition, components and requirements
- 4. The role of the Administration: the EU, the State, the regional and local governments
- 5. Energy supply: petroleum products, natural gas and electricity
- 6. The functioning of the market for gas, electricity and petroleum fuels
- 7. Energy consumption: characteristics and determinants
- 8. Energy and the city
- 9. Sectoral, territorial and urban planning
- 10. Territorial conflicts: Energy NIMBY
- 11. Social conflicts: energy poverty
- 12. New forms of relationship between suppliers and consumers

Block 2: Environmental Management

- Introduction to the concept of sustainability
- Sustainability tools:
 - Life Cycle Assessment
 - Environmental risk assessment and decision support
 - Environmental Impact Assessment
 - Ecodesign and Ecolabelling
 - Environmental and energy management systems (ISO 14001: 2015, EMAS Regulation)
 - IPPC Directive
 - Environmental and energy audits

Methodology

The subject will be structured around two main classroom activities, theory classes and practical exercises. The practical exercises, carried out with a computer, will provide the students opportunity to practice how to look for information, and select, treat, analyse and represent data on the subjects explained in the theory class. It is aimed to follow the evolution of each student in the understanding and use of the tools applied in the subject.

Apart from the directed activities, the students will have to spend time outside the classroom to complete those practical exercises not finished in classes, as well as to carry out the recommended readings for each topic.

During the theory classes, students will ask open-ended questions that will allow them to demonstrate their creativity, initiative and sensitivity towards social and environmental issues (T02).

In order to carry out the practical exercises successfully, innovative and competitive proposals must be generated in the professional activity (T03). At the same time, the realization of practical exercises will allow to generate proposals to prevent and to solve problems, adapting to unforeseen situations and to take decisions (T04).

Activities

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Classroom exercises (practical)	30	1.2	3, 10, 9, 5, 6, 11, 12
Lectures	30	1.2	1, 10, 4, 8, 7
Type: Supervised			
Conducting practical excercises	30	1.2	2, 3, 10, 9, 5, 6, 11, 12
Oriented readings	10	0.4	4, 7
Type: Autonomous			
Information search	10	0.4	3, 12
Reading and individual study	23	0.92	2, 10, 9, 4, 6, 7

Assessment

The evaluation of the subject will be done progressively and continuously throughout the semester. The evaluation system is based on the following learning evidences:

- The presentation of reports, in writing and orally, relating to computer practices, problems or case studies worked during the course, with the aim of following the evolution of each student in the understanding and use of the tools worked in the subject. The presentation of reports will allow us to evaluate the capacity to generate innovative and competitive proposals in the professional activity (T03) as well as the capacity to prevent and to solve problems adapting to unforeseen situations and to take decisions (T04).
- An examination for each block and a final examination (in case of re-evaluation), to favour the consolidation of all the material worked during the course.

Evaluation criteria

The final grade will be the result of the weighted sum of the grades of the two modules:

Final grade = 50% Energy module + 50% Environmental module

The mark from each module will be calculated from the weighted sum of the grading of various activities:

Final mark = 50% (internships / projects) + 50% (exams) (1)

There will be an exam for each of the Block. If the student passes the exam (gets more than 5), this part of the subject is released. It will be a necessary condition to carry out this weighted sum (1) that the practices are approved (which implies that all the practices must be carried out) and that the qualification obtained in the exams is equal or superior to 5. It will be a necessary condition to carry out these weighted sum (1) that the practices are approved (which implies that all the practices must be made) and that the grade obtained in the exams is equal or superior to 5. It is important to emphasize that the practices must be made and delivered on the dates indicated to the effect by the professor of the subject since they will not be allowed later submission.

Re-evaluation

For those students who at the end of the evaluation process have not obtained a grade equal to or higher than 5 on the exam score, but have more than a 5 to the practice, there will be a re-evaluation. It will consist in the realization, in the date foreseen for the Faculty and programmed in the last week of the semester, of a representative examination of the situations worked during the course. The students only have to present themselves to the theory part that they have not passed before the partial or final exam. If a student does not reach the minimum grade of 5 in exams and for this reason does not pass the subject, he will have a 4.5 in the final grade of the subject. For repeat students, the theory grade of the passed parts is not saved from one course to another. However, the mark of the practice will be saved from one course to another.

Not eligible for evaluation

A student who has not taken an exam is considered "non-assessable". Otherwise, the evaluation criteria detailed above are followed.

Plagiarism or irregularities in the evaluation of the subject

Without prejudice to other disciplinary measures deemed appropriate, and in accordance with current academic regulations, irregularities committed by a student that may lead to a variation of the grade in an evaluable activity will be graded with a zero (0). Evaluation activities rated in this manner and by this procedure will not be recoverable. If it is necessary to pass any of these evaluation activities in order to pass the course, this course will be suspended directly, without the opportunity to recover it in the same course. These irregularities include, among others:

- the total or partial copy of a practice, report, or any other evaluation activity;
- allow copying;
- present a group work not done entirely by the members of the group (applied to all members, not just those who have not worked);
- present as their own materials produced by a third party, even if they are translations or adaptations, and in general work with elements that are not original and exclusive to the student;
- have communication devices (such as mobile phones, smart watches, camera pens, etc.) accessible during individual theoretical-practical assessment tests (examinations);
- talk to colleagues during individual theoretical-practical assessment tests (examinations);

- copy or attempt to copy other students during theoretical-practical assessment tests (examinations); - use or attempt to use subject-related writings during the theoretical-practical assessment tests (examinations), where these have not been explicitly permitted.

In case of not passing the subject due to the fact that some of the evaluation activities do not reach the minimum required grade, the student will be graded the lowest value between 4.5 and the weighted average of the grades. Students who do not participate in any of the evaluation activities will be awarded the grade of "Not Evaluable", and also "Not Evaluable" is given to those that has grade lower than 3.0 and the weighted average of the grades, in case the student has committed irregularities in an evaluation act (and therefore there will not be any compensation or recovery exam for this case). In future editions of this subject, the student who has committed irregularities in an act of evaluation will not validate any of the evaluation activities carried out.

In summary: copying, letting copy or plagiarize (or attempting to) in any of the evaluation activities result in a SUSPENSE, not compensable and without validation of parts of the subject in subsequent courses.

Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
Energy Practices / projects	25%	7.5	0.3	1, 2, 3, 10, 9, 4, 5, 6, 7, 11, 12
Environmental Management Practices / projects	25%	7.5	0.3	1, 2, 3, 10, 9, 4, 5, 6, 7, 11, 12
Exam Block Environmental Management	25%	1	0.04	1, 2, 10, 9, 6, 8, 11, 12
Exam Block energy	25%	1	0.04	1, 2, 10, 9, 6, 8, 11, 12
