## Prerequisites

Since it is a first year course, there are no academic prerequisites to enroll.

In any case, it must be taken into account that the subject contains a large part of laboratory sessions and requires a specific regulation. The behavior in the laboratory must follow the Safety Standards in the Teaching Laboratories published by the Chemistry Department.

Before starting the course, students have to fill in the security test that appears on the "Campus Virtual" and, once passed, print and sign the sheet that accredits it. This sheet must be delivered the first day of the laboratory. Without this document you can not do the practices.

The rules can be found at the following address: [http://www.uab.cat/doc/DOC\\_Normativa\\_Segur\\_Lab\\_Docent](http://www.uab.cat/doc/DOC_Normativa_Segur_Lab_Docent)

During practices, students must wear the lab coat and approved safety glasses. In addition to the usual writing tools, they have to carry (and know how it works) a scientific calculator that can do regression calculations. It is advisable that they go in the laboratory with a laptop to do calculations with Excel

## Objectives and Contextualisation

The final objective of the subject is that the student reaches the indicated competences.

The part of Experimentation in the laboratory has some general objectives:

- Know and apply safety and work regulations in the laboratory.
- Know the waste disposal system in the laboratory.
- Know the basic material of the chemical laboratory.
- Know the basic operations of the chemical laboratory:
  - weigh out
  - Cleaning the glass materia
  - Measurement and transfer of liquids
  - Preparation of solutions
  - Heating of substances
  - Agitation
  - Evaporation
  - Crystallization
  - Filtering and washing substances
  - Simple Extraction
  - Thin layer chromatography
  - Distillation
  - Use of the laboratory notebook
  - Graphic, numerical and computer treatment of laboratory data

As specific objectives of each practice:

Practice 1: Data processing

- Take contact with the concepts of experimental error, accuracy and precision.
- Understand that the glass material for measuring volumes can have two different functions: contain an exact volume and transfer an exact volume.
- Basic statistics calculations.
- Evaluate the precision and accuracy of some results.
- Introduction to the use of a spreadsheet as a tool to represent results.

- Learn to weigh with the following scales: analytical, precision and granetari.
- Learn volumetric techniques and verify their accuracy.

#### Practice 2: Densities

- Prepare different solutions of known concentration of a salt using different scales: molarity, molality and both weight percent.
- Extract information from the graph of concentration and density of the solution.
- Use the regression by least squares and determine the concentration of a problem solution from the reading of the graph.
- Relate molarity (M), molality (m) and percentage by weight (%).
- Work with different scales of concentration.

#### Practice 3: Precipitation reactions. Limiting reagent concept

- Learn the filtration technique for the separation of heterogeneous phases (solid-liquid).
- Observe the concept of limiting reagent with a practical case, adding variable amounts of a soluble salt in the same amount of another soluble salt (which will act as a limiting reagent).
- Observe the insolubility of some salts from the mixture of soluble salts.
- Learn a technique for purifying precipitates.

#### Practice 4: Redox reactions. Reaction stoichiometry in aqueous solution

- Use the concept of oxidant and reducer by studying simple redox reactions.
- Remember the rules of equalization of redox reactions.
- Demonstrate the differentiated behavior of some reagents in redox reactions depending on whether you work in an acid medium or in a basic medium.
- Basically analyze the solubility of substances in different solvents.
- Make liquid-liquid extractions of substances from one solvent to another of different polarity.
- Determine the concentration of a test solution using a redox reaction.

#### Practice 5: Atomic and molecular orbitals

- Understand the meaning of different representations of atomic orbitals.
- Understand the information that can be extracted from the wave function.
- Visualization of molecular orbitals of homonuclear and heteronuclear diatomic molecules
- Construction of molecular orbital diagrams
- Identification of  $\sigma$  and  $\pi$  molecular orbitals in diatomic molecules
- Energy of the molecular orbitals  $\pi$  and relation to the number of nodes
- HOMO-LUMO separation in  $C_{2n}H_{2n} + 2$  molecules ( $n = 1, 2, 3$ )
- Molecular orbitals  $\pi$  of benzene,  $CO_2$

#### Practice 6: Molecular geometry. Crystal strings

- Visualize the shapes of simple molecules.
- Observe the effect of non-binding pairs of the central atom on molecular geometry.
- Observe the effect of double bonds on molecular geometry.
- Observe the effect of peripheral atoms on molecular geometry.
- Study the structure of metals, ionic solids and covalent solids from molecular models and the use of ChemBio3D software, and make simple predictions of different properties (atomic radii, contact directions, densities, reticular energies, etc.)

#### Practice 7: Determination of atomic and molecular masses

- Learn to manipulate and make calculations with gases.
- Apply the law of ideal gases and Dalton's law of partial pressures.
- Determine the equivalent mass and the atomic mass of a metal from a chemical reaction.
- Determine the molecular mass of a gas from its density.

- Calculate the average molecular mass of the air.
- Work with the vapor pressure of the water in the air and with the concept of relative humidity.

#### Practice 8: Using the calorimeter to study phase change and dissolution processes

- Determine the calorific capacity of the calorimeter using the method of mixtures, since it is a data that we need to know to complete this practice and the following ones.
- Determine the latent heat of ice melting.
- Determine the enthalpy of dissolution of two liquid substances.

#### Practice 9: Determination of heat of reaction and dissolution

- Determine the heats of reaction (enthalpies of reaction) of different chemical processes (acid / base and redox) in solution by using a calorimeter at constant pressure
- Analyze the factors on which the measured enthalpy changes depend. Study the stoichiometry of acid-base neutralization reactions.
- Compare the reaction enthalpies of the acid-base and redox reactions.

#### Practice 10: Determination of the enthalpy and entropy variation of the urea solution

- The objective of the experiment is to determine  $\Delta H_o$  and  $K_{eq}$  for the dissolution of urea,  $NH_2CONH_2$ , in water. From this information,  $\Delta G_o$  and  $\Delta S_o$  will be calculated.

#### Practice 11: Liquid-liquid extraction and separation of mixtures

- Learn the simple extraction technique.
- Separation of three known substances dissolved in an organic solvent from a simple extraction process taking advantage of the different acid-base character of the substances to be separated.
- Checking the efficiency of the separation using the thin layer chromatography technique.
- Separation of an unknown binary mixture. A problem sample will be assigned and information will be given to the student about the compound title it contains. Recognize the separated substances.

#### Practice 12: Kinetics of the reaction of methyl violet in basic medium

- Determine the pseudo-constant velocity  $k'$  for the reaction of methyl violet in basic medium in excess of hydroxyl ion and at room temperature.
- Determine the order of the reaction with respect to hydroxyl and methyl violet.
- Determine the rate constant  $k$  for the reaction of methyl violet in basic medium.

#### Practice 13: Measurement of pH. Relative strength of acids and bases

- Learn to use a pH meter.
- Measure the pH of a set of aqueous solutions of acids and bases and sort them according to their relative strength.
- Observe the influence of dilution on balance.
- Observe the different behavior between buffer solutions and undamped systems from the observation of pH changes when a strong acid or base is added.

#### Practice 14: Acid-base volumes. Indicators

- Achieve the basic methodology to carry out volumetries, which in this case are based on acid-base equilibria.
- Experimental study of the importance of choosing the indicator correctly.
- Know how to build an experimental valuation curve, check that it has the theoretically predicted form, and see that the indicators change in the predicted area.

#### Practice 15: Determination of the acidity constant of acetic acid

- In general terms, the objective of this experiment is the quantitative study of the chemical equilibrium by analyzing an acid-base equilibrium in aqueous medium.

- Determine the acidity constant of the acidic and observe that the equilibrium constants correspond to a "palpable" reality experimentally.
- Learn to obtain quantitative data from a series of experimental results that follow a physical law.

Practice 16: Solubility and K<sub>ps</sub> of salts poorly soluble in water. Effect of the common ion

- Learn to prepare a saturated solution of a poorly soluble salt in a controlled manner.
- Determine the solubility of a poorly soluble salt.
- Learn the practical concept of ion exchange.
- Determine the solubility product of a poorly soluble salt.
- Observe and reflect on the effect of the common ion.

Practice 17: Electrochemical Cells

- Construction of a Table of Potential Standards
- Construction of simple electrochemical galvanic cells to obtain electricity from chemical reactions.

Practice 18: Synthesis of acetylsalicylic acid

- Synthesize a certain amount of acetylsalicylic acid (ASA) from commercial salicylic acid (AS).
- Purify the reaction product (AAS).
- Determine the performance of the reaction.
- Discuss, qualitatively, the purity of the product obtained.

For the part of Computer Resources, the general objective is to provide a solid basis for students in cross-cutting and specific skills in computer tools. It is intended that the students acquire strong notions, both structural and analytical in database management and algorithm.

## Competences

- "Interpret data obtained by means of experimental measures, including the use of IT tools; identify their meaning and relate the data with appropriate chemistry, physics or biology theories."
- Adapt to new situations.
- Apply knowledge of chemistry to problem solving of a quantitative or qualitative nature in familiar and professional fields.
- Be ethically committed.
- Communicate orally and in writing in one's own language.
- Evaluate the health risks and environmental and socioeconomic impact associated to chemical substances and the chemistry industry.
- Handle chemical products safely.
- Handle standard instruments and material in analytic and synthetic chemical laboratories.
- Have numerical calculation skills.
- Learn autonomously.
- Manage the organisation and planning of tasks.
- Manage, analyse and synthesise information.
- Obtain information, including by digital means.
- Propose creative ideas and solutions.
- Reason in a critical manner
- Recognise and analyse chemical problems and propose suitable answers or studies to resolve them.
- Resolve problems and make decisions.
- Show an understanding of the basic concepts, principles, theories and facts of the different areas of chemistry.
- Show initiative and an enterprising spirit.
- Show motivation for quality.
- Show sensitivity for environmental issues.

- Use IT to treat and present information.
- Use the English language properly in the field of chemistry.

## Learning Outcomes

1. Adapt to new situations.
2. Be ethically committed.
3. Communicate orally and in writing in ones own language.
4. Determine concentrations of acid and bases from acid-base estimations.
5. Have numerical calculation skills.
6. Identify safety measures in a chemistry laboratory.
7. Identify the main bibliographic sources in the field of chemistry.
8. Learn autonomously.
9. Manage the organisation and planning of tasks.
10. Manage, analyse and synthesise information.
11. Name and formulate the organic and inorganic chemical compounds.
12. Obtain information, including by digital means.
13. Perform basic synthesis, separation and analyses procedures in a chemistry laboratory.
14. Perform bibliographic inquiries in the field of chemistry using sources of information in English and recognise the basic chemistry terms in this language.
15. Perform bibliographic research of chemical documentation.
16. Properly use glass materials in a chemistry laboratory.
17. Properly use the protocols for handling reagents and chemical waste taking into account their physical and chemical properties.
18. Propose creative ideas and solutions.
19. Rationalise the results obtained in the laboratory in processes of synthesis, separation and analysis of chemical compounds on the basis of knowledge of their structure and properties.
20. Reason in a critical manner
21. Resolve problems and make decisions.
22. Show initiative and an enterprising spirit.
23. Show motivation for quality.
24. Show sensitivity for environmental issues.
25. Use IT to treat and present information.
26. Use computer programs for the statistical treatment of data.
27. Work properly with chemical equations and the main magnitudes of matter.

## Content

The subject consists of two differentiated parts: Experimentation in the laboratory (5 ECTS) and Computer Resources (3 ECTS).

Each of the parties has a specific content. The Experimentation part is structured in 4 blocks, and each consists of several practices in the laboratory, except block 2 that consists of two practices in the computer room. The Computer Resources part consists of ....

### PRACTICES OF EXPERIMENTATION IN CHEMISTRY

BLOCK 1: Introduction to experimentation in Chemistry

Practice 1: Data processing. Measurement of volumes. Experimental errors. Use of Excel to make graphs and calculations

Practice 2: Densities. Determination of the concentration of a solution from its density. Use of excel to make graphs and linear regressions

Practice 3: Precipitation reactions. Limiting reagent concept. Performance of precipitation reactions of  $\text{CaCO}_3$

Practice 4: Redox reactions. Stoichiometry of the reactions in aqueous solution. Redox reactions in test tube. Determination of the concentration of a test solution by means of a redox reaction.

## BLOCK 2: Atomic structure and link

Practice 5: Atomic and molecular orbitals. Study of simple atomic orbitals. Use of the ChemBio3D program to study the molecular orbitals of homo and heteronuclear diatomic molecules. Calculation of molecular orbitals and use of the HOMO LUMO concept.

Practice 6: Molecular geometry. Structures cristal-lines. Use of the ChemBio3D program to study geometries of molecules according to the theory of repulsion of the orbitals of the valence shell. Visualization, with models and on the computer, of different ion structures and covalent solids.

## BLOCK 3: Thermodynamics and kinetics

Practice 7: Determination of atomic and molecular masses. Determination of the molecular mass of a gas. Determination of the equivalent mass and the atomic mass of a metal.

Practice 8: Use of the calorimeter to study phase change processes. Calibration of a digital thermometer. Calculation of the calorific capacity of the calorimeter. Determination of hot melting ice.

Practice 9: Determination of heat of reaction. Determination of neutralization enthalpies in acid-base reactions and dissolution enthalpies.

Practice 10: Determination of the enthalpy and entropy variation of the urea solution. Calculation of the Gibbs free energy and the reaction constant of the urea solution in water.

Practice 11: Liquid-liquid extraction and separation of mixtures. Separations of known and unknown mixtures of two and three components. Identification by thin layer chromatography.

Practice 12: Kinetics. Kinetics of the reaction of methyl violet in basic medium. Study of reaction kinetics following spectrophotometrically the concentration of methylviolet. Calculation of the order of the reaction and the speed constant.

## BLOCK 4: Chemical equilibrium, electrochemistry and organic functional groups

Practice 13: Measurement of pH. Relative strength of acids and bases. Calibration and use of a pH meter. Study of buffer concept. Calculation of the degree of dissociation of a weak acid.

Practice 14: Acid-base volumes. Indicators. Performance of acid-base titrations with indicators and potentiometric monitoring. How to choose the right indicator for a valuation.

Practice 15: Determination of the acidity constant of acetic acid. Application of the method of solutions. Using a graphical method and the least-squares adjustment to find a dissociation constant.

Practice 16: Solubility and Kps of salts poorly soluble in water. Effect of the common ion. Determination of the solubility of  $PbCl_2$  in water. Preparation and use of ion exchange resins. Determination of the Kps of  $PbCl_2$ . Effect of the common ion.

Practice 17: Electrochemical Cells. Construction of galvanic cells. Calculation of potential tables.

Practice 18: Synthesis of acetylsalicylic acid. Obtention and purification of the product from commercial salicylic acid.

The content of the Computer Resource part includes the following practices:

### Block I.1 Basic Excel

Practice 1. Introduction to Excel, data organization, open-import-export data, general presentation of the software, elementary calculations, format and conditional format, adjust decimals, sort order, apply sort filters.

Practice 2. Statistical formulas (variability in software language function), logical formulas.

Practice 3. Graphs, histograms, bars, x-y, line adjustments / trend curve.

Practice 4. Templates and forms.

### Block II.1 2D, 3D structures and databases

Practice 5. Introduction 2D molecular drawing.

Practice 6. 3D geometry and exploration of conformations.

Practice 7. Molecular representation: Models, perspectives, animations.

Practice 8. Scifinder.

Practice 9. Safety files.

## Block I.2

- Practice 10. Dynamic tables.
- Practice 11. Data analysis.
- Practice 12. Advanced graphs and regressions.
- Practice 13. Excel Solver.
- Practice 14. Excel in the cloud. Open source equivalents.

## Block II.2

- Practice 15. Introduction to Linux.
- Practice 16. Introduction to Python. Command script interface (IDLE, JUPYTER).
- Practice 17. Variables, bookstores, loops.
- Practice 18. Functions, objects.
- Practice 19. Import and exploitation of scientific Modules.
- Practice 20. Python integration in chemical fields.
- Practice 21. Definition of projects.

## Methodology

The subject "Experimentation and Computer Resources" (8 ECTS), together with the subject "Fundamentals of Chemistry I" and "Fundamentals of Chemistry II (16 ECTS), is part of the" Chemistry "subject of the Chemistry degree, which has a total of 24 ECTS of a basic nature and located in the first year of the Degree. The subjects are totally independent with respect to the evaluation, but they are coordinated, so that the evaluation of the part of the subjects "Fundamentals of Chemistry I and II "which is related to the practices, is done after finishing the corresponding block of practices, so the practices benefit from having the theoretical explanations close to time and serve to finish understanding the theory.

The laboratory practices consist of 4 blocks, after which the specific subject is dealt with in the theory subject. Each laboratory block has several practices, of 4 hours each, which are carried out in the laboratories of the Chemistry Department or in the Computer Room of the Faculty. The last session of the block is devoted to the correction and commentary of the practices carried out. Before starting the practices there will be a joint session in a classroom where the rules that appear in this Teaching Guide and the last minute information will be remembered.

The laboratory practices are done in pairs and each block of practices change the partners of the couples. For each block of practices, the lists of pairs are published on the virtual campus. The evaluations are individual.

Assistance is mandatory. An unjustified fault implies a zero of the practice. Students must enter the laboratory with the guide of the practice read and the calculations requested by the preparation of solutions prepared. They may have to do a short test (less than 10 minutes) to verify that they have actually read the guide.

Before each practice, the teacher will explain the most important points and the details to take into account.

Once the practice is finished and the material is ordered, the students fill out, individually, the practice report and answer the questions that are asked for their evaluation. In some specific cases, the students may take the report home so they can make the calculations more calmly and hand it over the next day.

The space of the subject in the "Campus Virtual" will be the place where the students will be able to find all the necessary documentation for the practices. Before starting the first block of practices will be published: safety standards in the laboratory and the book of practices, which contains a first part explaining the usual techniques in the laboratory and the scripts of all practices.

Before starting the course, students must take the security test that appears on the virtual campus and, once passed, print and sign the sheet that states it. This sheet will be delivered the first day in the laboratory. Without this document you can not do the practices.

Punctually, before each block, the specific calendar and list of pairs of the block will be published. Subsequently, the ratings of the block will be published.

The part of Computer Resources consists of 21 practices that are carried out in the computer classroom. The duration of each practice is 2h and the attendance is mandatory. At the beginning of each block of practices, a description of the content and competences to be achieved during the duration of the block will be made. Before each practice, the teacher will briefly explain the session.

Attendance to each practice is mandatory. An unjustified absence involves a zero of the practice. There will be different assessment tests on each given class.

## Activities

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Computer classrom sessions	52	2.08	1, 11, 3, 22, 4, 13, 9, 10, 12, 19, 20, 14, 15, 21, 5, 27, 17, 25, 26
Theory lesson	1	0.04	11, 9, 6, 27
laboratory practices	72	2.88	11, 8, 3, 22, 23, 4, 13, 9, 6, 16, 18, 19, 20, 21, 5, 27, 17, 26
Type: Autonomous			
Project of the Computational Resources part	28	1.12	8, 3, 22, 23, 9, 10, 12, 18, 20, 14, 21, 5, 25, 26
Reading guides and preparation of laboratory practices	18	0.72	11, 8, 9, 10, 20, 5, 27

## Assessment

All the activities that are carried out count for the evaluation.

The two parts of the subject have an individual and independent evaluation. The final grade is the average of the marks of the two parts of the subject, weighted by the number of credits of each part.

It is necessary to approve the two parts to pass the subject.

Regarding the part of Experimentation in the laboratory: A continuous evaluation system is followed, without the possibility of re-evaluation with a work or special examination. The minimum qualification to pass it is 5 points (out of 10). In this note the most important weight is the reports that are delivered at the end of each practice (weight 80%). In the report you must put the experimental results obtained in practice and answer the questions that are asked, leaving evidence of the necessary graphics and calculations. The methodology followed for the answers, the way in which the answers are communicated and the goodness of the experimental data found are valued. Pre-laboratory tests (before starting each practice) will also be taken into account to demonstrate that the reports and work attitude in the laboratory have been read (weight 20%). The non-attendance to the session of correction and comment of the practices of the block has a penalty of 1 point (out of 10) in the note of the block. The final grade of this part will be the average of the scores of all the blocks.

Assistance is mandatory. An unjustified absence implies a zero of the practice.

Safety warning in the laboratory: The student who is involved in an incident that may have serious safety consequences may be expelled from the laboratory and suspend the subject.

There will be three types of evaluation activities in the Computer Resources Part. A series of tests to answer, generally for each class, of approximate duration of 10 '. The average obtained by these activities will have a total weight 40% in the final note of the block of this part. Also a series of non-attendance tests to be solved periodically. This part will have a 25% weight in the final note. Finally, a group project will have to be made and presented in a written way (for example, a tutorial or a manuscript). The last practice session is devoted to the preparation of this activity. It will have a weight of 35% on the final grade of the subject.

## Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
Non-attendance assessment in the form of tests (Computational Resources part)	25%	2	0.08	8, 22, 23, 7, 2, 12, 18, 20, 21, 5, 25
Practice Report (part Experimentation)	80%	15	0.6	1, 11, 8, 3, 23, 4, 13, 9, 10, 6, 16, 2, 24, 19, 20, 21, 5, 27, 17, 26
Preparation of practices. Pre-laboratory exercise (Experimentation part)	20%	3	0.12	11, 3, 6, 5, 27
Project presentation (Computational Resources part)	35%	5.5	0.22	1, 8, 3, 23, 10, 2, 18, 20, 21
assessment in the form of tests (Computational Resources part)	40%	3.5	0.14	8, 10, 12, 20, 14, 15, 21, 5, 25, 26

## Bibliography

Main reference textbooks:

- The main document for the laboratory part is the "Book of practices of the subject Experimentation in Chemistry". Chemistry Department. It contains the necessary information to work in the laboratory and the guides of all the practices. Each practice indicates which concepts of the book should review. It is located in the "Campus Virtual" of the UAB.

- The textbook "R.H. Petrucci, W.S. Harwood and F.S. Herring." Química General "8th ed .. Pearson-Education S.A., Madrid (2003)" will provide the theoretical information necessary for each practice. In the guide of each one are indicated the pages of the book that should be read.

Complementary textbooks:

- A book of laboratory practices that can be found in the library in case one of the experiments is not clear. Manuel Fernández González, Laboratory Operations of Chemistry, Ed. Anaya (2004).

-A textbook that is in the library and that contains explanations about the use of Excel, significant figures and complementary information on block 4 (Chemical Balance). Daniel C. Harris. "Quantitative chemical analysis". Ed. Reverté S.A. Barcelona (2006)

- A book that is in the library and that provides more information about block 3 (Thermodynamics and kinetics) and block 4 (Electrochemistry). R. Chang. General Chemistry, 9th edition, Ed. McGraw-Hill, 2007.
