Improving the Quality of Food From the Food Industry

Code: 43033
ECTS Credits: 9

Use of Languages

Principal working language: spanish (spa)

Contact

Name: Victoria Ferragut Pérez
Email: Victoria.Ferragut@uab.cat

Teachers

Marta Capellas Puig
Montserrat Mor-Mur Francesch
Reyes Pla Soler
Antonio José Trujillo Mesa
Manuel Castillo Zambudio
Bibiana Juan Godoy

Prerequisites

No official requirements are defined for this course. However, we strongly recommend that the student has basic knowledge in general process at the food industry, and Food chemistry and composition.

Objectives and Contextualisation

To establish criteria for proper food processing to ensure its quality, taking into account all stages until the food reaches the consumer.

To study conventional processes applied in the agri-food industry to products of animal origin, referred to the quality module from the farm as well as their derivatives. It involves using appropriate criteria to the characteristics of processed food consumption and identifying relevant issues that affect and determine their quality at different stages of the process, from previous treatments until the product reaches the consumer. It's also included the study of different aspects that affect and guarantee product quality such as composition, physical, chemical, biochemical and microbiological properties as well as the proper use of additives.

Competences

- Continue the learning process, to a large extent autonomously.
- Design, organise and execute projects related to this field of study, working alone or in a unidisciplinary or multidisciplinary team, displaying a critical sense and creativity, and the ability to analyse, synthesise and interpret information.
- Distinguish the quality parameters of fresh and processed foods in accordance with their standards.
- Establish appropriate processes for maintaining or improving the quality of fresh and processed foods in accordance with their quality standards.
- Integrate knowledge and use it to make judgements in complex situations, with incomplete information, while keeping in mind social and ethical responsibilities.
- Search for information using the appropriate channels and use this information to solve problems in the work context.

Learning Outcomes

1. Choose the correct packaging and storage conditions for the product until it is consumed.
2. Choose the most important quality-control parameters for the process and the final product and the parameters for determining the food's shelf life.
3. Continue the learning process, to a large extent autonomously.
4. Decide on ingredients to use, and identify their functions.
5. Describe the stages of food production, identifying their impact on the overall process and on the characteristics of the final product.
6. Establish the essential quality parameters for defining quality.
7. Identify the modifications that can take place during the processing and storage of the product.
8. Integrate knowledge and use it to make judgements in complex situations, with incomplete information, while keeping in mind social and ethical responsibilities.
9. Present one's own work or discussions arising from the different courses within the module, in oral and/or written form and following scientific and technical criteria.
10. Relate the composition of a food to its characteristics.
11. Use scientific and technological criteria when choosing treatments to be applied.
12. Use search tools correctly when completing the activities in the module, and show that the information found has been used, interpreted and integrated.

Content

1. Milk and dairy products

- Other dairy products: Ice cream, cream, butter, milk powder, condensed milk.

2. Meat and meat products

- Quality of fresh meat: strategies in slaughterhouse and cutting rooms. Sanitary, organoleptic quality and shelf life.

- Injected meats: differentiation between legislation, organoleptic and nutritional quality. Ingredients and additives according to their function. Industrial performance

- Restructured meats: applicable technologies, ingredients and necessary additives. Potential of meat design of desired composition.

- Quality of heat treated meat derivatives according to business objectives: desirable properties of raw materials and evolution of products over the years.
- Quality of fermented meat products according to business objectives: desirable properties of raw materials and evolution of products over the years.

3. Fish and derived products.
- Optimization of the processing of fishery products: based on the known quality factors of each type of product and pursuing the benefits for the environment, industry and the consumer.
- Evaluation of the quality of fish and processed products: deepen the most recent contributions of instrumental and sensory analytical methods.

4. Eggs and egg products.
- Quality assessment: current methodologies applicable to shell eggs, non-destructive and isolated components and their derivatives most used in the industry.

Methodology
The methodology of the module will be based on lectures, labs, and conferences by professionals of the food industry; seminars and presentations of works by students by means of shelf learning:

Milk and milk products:
- Lectures: general introduction and quality control of milk, yogurt and fermented milk and cheese.
- Quality control in the dairy industry producer of pasteurized / sterilized milk: seminar / conference conference by professionals.
- Influence of production factors in yoghurt quality and quality control of finished product: lab.
- Influence of coagulating milk and whey from the curds in cheese quality: lab.
- Quality control of cheese: lab.
- Quality of ice creams: lecture by professional.
- Self-learning: students, in small groups (2-3 people), will study the main effects that determine the quality of dairy products by means of an oral presentation.

Meat and meat products
- Lectures: general introduction to all topics.
- Self learning: students, in small groups (2-3 people), will study in depth one of the proposed topics.
- Lab: use of additives in meat products and their influence on the final quality.

Fish and fishery products
- Lectures: raw and processed fish products material.
- Lab: relationship between raw materials and treatments on quality.
- Quality control in the fishing industry: conference by an industry professional.

Eggs and egg products
- Lectures: Egg and egg products processing.
- Lab: Quality of raw material: assessment methods.
- The quality of egg production: speech by an industry professional of the trade.

**Assessment**

The competences of this module will be evaluated by subject:

- **Milk and milk products**: 40% attendance at theoretical and practical classes and 60% self-learning work.

- **Meat and meat products**: a) 40% attendance to theoretical and practical classes; b) 40% self-learning work; c) 20% questions about the self-learning work. The note of b) will be from the notes made by the teacher and the classmates.

- **Fish and derived products**: presentation of a research article, in English, in pairs. The mark will be from the notes made by the teacher and classmates.

- **Eggs and egg products**: presentation of a research article, in English, in pairs. The mark will be from the notes made by the teacher and classmates.

The final mark will be the weighted average taking into account the number the load of the different subjects in the module.
