

**Biology and Diversity in Terrestrial Vertebrates**

Code: 100850  
ECTS Credits: 6

Degree	Type	Year	Semester
2500251 Environmental Biology	OT	4	0

The proposed teaching and assessment methodology that appear in the guide may be subject to changes as a result of the restrictions to face-to-face class attendance imposed by the health authorities.

### Contact

Name: Francesc Muñoz Muñoz  
Email: Francesc.MunozM@uab.cat

### Use of Languages

Principal working language: catalan (cat)  
Some groups entirely in English: No  
Some groups entirely in Catalan: Yes  
Some groups entirely in Spanish: No

### Other comments on languages

Some teaching materials (informative texts, articles, videos, etc.) may be in English

### Teachers

Alejandro García Salmerón  
Marc Martin Perez

### Prerequisites

To have passed the subjects of "Zoology" and "Extension of Zoology" of the Degree of Biology or the Degree of Environmental Biology.

### Objectives and Contextualisation

The main goal of this subject is that the students acquire theoretical and practical knowledge on the anatomy, diversity and evolution of the main groups of tetrapods (see Theory section). In addition, that they learn the most relevant biological aspects and, in particular, the adaptations to the environment and life strategies of the most diversified groups.

The specific training aims are the following:

- To consolidate and to expand the knowledge on the general morphological characteristics of the main tetrapod lineages.
- To know the diagnostic features of the main taxa.
- To know the appearance in the fossil record of the main lineages and the essential factors involved in their subsequent diversification.
- To obtain an overview of the internal phylogenetic relationships of the main lineages.

- To understand the adaptations to the environment of representative taxonomic groups.
- To know essential aspects about the biology and the ecological importance of representative taxonomic groups.

## Competences

- Adopt an ethical stance.
- Communicate efficiently, orally and in writing.
- Develop a sensibility towards environmental issues.
- Identify and interpret the diversity of species in the environment.
- Identify organisms and recognise the different levels of biological organisation.
- Integrate knowledge of different organisational levels of organisms in their functioning.
- Obtain, observe, handle, cultivate and conserve specimens.
- Recognise and analyse phylogenetic relations.

## Learning Outcomes

1. Adopt an ethical stance.
2. Collect, determine and conserve specimens and collections of invertebrates and vertebrates.
3. Communicate efficiently, orally and in writing.
4. Develop a sensibility towards environmental issues.
5. Interpret and recognise the different states of development of invertebrates and vertebrates.
6. Interpret the distribution and the interactions in the environment of invertebrates and vertebrates and their impact on biological diversity.
7. Interpret the evolutionary processes that have led to the diversity of invertebrates and vertebrates.
8. Interpret the origin and functioning of organic structures in the different groups of invertebrates and vertebrates.
9. Recognise the characteristics that distinguish the principal groups of invertebrates and vertebrates.

## Content

### Theory

Topic 1. Origin and radiation of the tetrapods. The transition of vertebrates to the terrestrial environment: transitional fossils, possible causes, and adaptations to the terrestrial environment.

Topic 2. Adaptations, biology and diversification of lissamphibians.

Topic 3. Amniotes. Sauropsids and synapsids: two approaches to terrestrial life.

Topic 4. Sauropsids. Phylogenetic relationships. Lepidosauromorphs. Diversification and biology of sphenodonts and squamates.

Topic 5. Phylogenetic position of turtles. Archaeosaurs. Testudinales. Evolution, diversification and biology.

Topic 6. Arcosauromorphs. Diversification and biology of crocodylians.

Topic 7. Dinosaurs: origin, synapomorphies and phylogeny. Origin and diversification of birds.

Topic 8. Avian specializations.

Topic 9. Synapsids. Diversification of synapsids. Mammals: synapomorphies and main lineages.

Topic 10. Biology and diversification of monotremes. Biology and diversification of marsupials. Radiation of the eutherians. Biology and adaptations of representative taxonomic groups of eutherians.

## Practical classes

Practice 1. Amphibians: morphology, diversity and identification.

Practice 2. Sauropsids: morphology, diversity and identification of squamates and turtles.

Practice 3. Mammals: morphology, diversity and identification.

Practice 4. Comparative study of the tetrapod skeleton.

## Field practices

Field trips to identify terrestrial vertebrate species and their signs in the natural environment and/or visits to research or conservation centres.

\*Unless the requirements enforced by the health authorities demand a prioritization or reduction of these contents.

## Methodology

The methodology used to achieve the learning process is based on the combination of lectures, seminars, personal study, and individual and group work.

### Theory

With these classes the students acquire the basic theoretical knowledge of the subject, which must be complemented with the personal study of the topics explained by the teacher. These classes highlight and address the essential points of each teaching unit. Subsequently, the student will have to supplement the conceptual map established during the classes with the information from different sources that will be provided to them. Classes last 50 minutes and in them audiovisual material prepared by the teacher will be used.

### Seminars

The aim of the seminars is to promote the capacity for analysis and synthesis, critical reasoning, and the capacity to solve problems. The seminars are designed for students to work in small groups, so that they mainly acquire the skills associated with this type of activity. During the seminars, topics related to the theoretical program will be actively worked and some of the following activities may be carried out: oral and/or written presentation of a topic, resolution of questions and problems, analysis and discussion of articles, cases or problems.

### Practices

During the lab sessions students will work on zoological material and will complement their knowledge with the study and the response of the issues raised by the teacher. The field practices will allow the students learn techniques of observation and identification of species. The objective of the practical classes is to complete and reinforce the zoological knowledge acquired in the master classes and seminars. Practical sessions will stimulate and develop specific skills, such as the ability to observe, analyze and interpret anatomical structures, detect adaptive characters or phylogenetic importance, and taxonomic identification of individuals. For its correct execution, students will be provided with a script for each of the established sessions.

### Tutorships

Tutorships will serve to clarify concepts, to establish acquired knowledge, to facilitate the study to the students and to solve possible eventualities that can arise during the development of the subject. The schedule of individualized tutorships will be specified with the teacher via email or orally.

\*The proposed teaching methodology may experience some modifications depending on the restrictions to face-to-face activities enforced by health authorities.

Annotation: Within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

## Activities

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Field practices	12	0.48	1, 5, 6, 9, 4
Laboratory practices	16	0.64	3, 8, 9, 4
Lectures	18	0.72	7, 5, 8, 6, 9
Seminars	6	0.24	3, 5, 6, 9, 4
Type: Autonomous			
Preparation of works and resolution of issues	34	1.36	
Study and resolution of issues	53	2.12	3, 7, 5, 8, 6, 9

## Assessment

The evaluation of this subject will be carried out by means of the the following procedures:

### Evaluation of the theoretical contents

The theoretical knowledge acquired by the students will be assessed individually. This evaluation will be carried out by means of two midterm exams (each with a weight of 30% of the final mark) that will contain test-type questions and/or short or medium development questions. Students who do not pass any of these exams (minimum mark: 5 out of 10) will have to recover them in a final exam that will contain questions of the same type as those of the midterm exams. Likewise, students who wish to improve the mark of any of these exams will have the opportunity to do it in the final exam, but the previously obtained mark will be lost. The evaluation of the theoretical contents has an overall weight of 60% (corresponding to the sum of the percentages of each midterm exam) of the final mark. In order to be able to average with the other evaluative activities (seminars and practices) the average mark of the two exams must be equal or greater than 4. To participate in the final exam, students must have been previously evaluated in a set of activities, which weight equals a minimum of two thirds of the total mark of the subject. Therefore, the students will obtain the "Not Evaluable" qualification when the evaluation of the activities performed have a weight lower than 67% in the final mark.

### Evaluation of the seminars

The content and quality of the works presented on the seminar days will be evaluated, as well as the evaluation tests (group and individual) that will be carried out during the course of the seminars. The grade corresponding to seminars has an overall weight of 15% of the final grade.

This activity has no possibility of recovery.

### Evaluation of practices

Attendance to laboratory practice sessions and field trips is mandatory. After each practice, students will take an individual test that assesses the use and achievement of the specific skills of each practice.

The grade corresponding to the practices has an overall weight of 25% of the final grade.

This activity has no possibility of recovery.

Final considerations

The minimum overall grade required to pass the course is 5 out of 10.

Anyone who, due to a justified cause (illness, death of a relative, accident, etc.), can not attend an individual assessment test and provides the corresponding official documentation, will have the right to perform this exam on another date.

\*Student's assessment may experience some modifications depending on the restrictions to face-to-face activities enforced by health authorities.

## Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
Individual evaluation (first midterm exam)	30% of the final mark	2.5	0.1	3, 7, 5, 6, 9
Individual evaluation (second midterm exam)	30% of the final mark	2.5	0.1	3, 7, 5, 6, 9
Laboratory and field practices	25% of the final mark	2	0.08	1, 3, 8, 2, 9, 4
Seminars (	15% of the final mark	4	0.16	1, 3, 7, 6, 9, 4

## **Software**

R software will be used at a basic level in one of the seminar sessions. In another of the seminars students will be introduced to the use of the free software Meshlab for viewing and editing 3D models.
