

Separation Techniques

Code: 102529
ECTS Credits: 6

Degree	Type	Year	Semester
2502444 Chemistry	OB	3	2

Contact

Name: Cristina Palet Ballus
Email: cristina.palet@uab.cat

Use of Languages

Principal working language: catalan (cat)
Some groups entirely in English: No
Some groups entirely in Catalan: Yes
Some groups entirely in Spanish: No

Teachers

Jordi Coello Bonilla

Prerequisites

It is necessary to have studied the subjects of Chemistry of the lower level classes, as well as those of the same course of the first semester.

Objectives and Contextualisation

The main objective of the subject of Separation Techniques is to get the student to understand the concepts, principles, theories and fundamental facts of the main separation techniques in Chemistry, both chromatographic and non-chromatographic. It also includes knowledge of the basics of relative chromatographic and non-chromatographic instrumentation, as well as various current and future fields of application. Simultaneously, the aim is for the student to be able to solve exercises and problems related to chemical separations, using different bibliographic sources.

Competences

- "Interpret data obtained by means of experimental measures, including the use of IT tools; identify their meaning and relate the data with appropriate chemistry, physics or biology theories."
- Adapt to new situations.
- Be ethically committed.
- Communicate orally and in writing in one's own language.
- Learn autonomously.
- Manage the organisation and planning of tasks.
- Manage, analyse and synthesise information.
- Obtain information, including by digital means.
- Operate with a certain degree of autonomy and integrate quickly in the work setting.
- Propose creative ideas and solutions.
- Reason in a critical manner
- Recognise and analyse chemical problems and propose suitable answers or studies to resolve them.
- Resolve problems and make decisions.

- Show an understanding of the basic concepts, principles, theories and facts of the different areas of chemistry.
- Show initiative and an enterprising spirit.
- Show motivation for quality.
- Show sensitivity for environmental issues.
- Use IT to treat and present information.
- Use the English language properly in the field of chemistry.
- Work in a team and show concern for interpersonal relations at work.

Learning Outcomes

1. Adapt to new situations.
2. Be ethically committed.
3. Communicate orally and in writing in one's own language.
4. Describe the basics of chromatographic instrumentation.
5. Describe the basics of the main chromatographic and non-chromatographic chemical separation techniques.
6. Evaluate the capacities of the information contained in online networks.
7. Identify the fields of application of the main chromatographic techniques.
8. Learn autonomously.
9. Manage the organisation and planning of tasks.
10. Manage, analyse and synthesise information.
11. Obtain information, including by digital means.
12. Operate with a certain degree of autonomy and integrate quickly in the work setting.
13. Propose creative ideas and solutions.
14. Reason in a critical manner
15. Recognise the English terminology in bibliographic databases and online information.
16. Resolve exercises and problems related with chemical separations using different bibliographic sources and simulation programs.
17. Resolve problems and make decisions.
18. Show initiative and an enterprising spirit.
19. Show motivation for quality.
20. Show sensitivity for environmental issues.
21. Use English scientific terms in the field of separation techniques.
22. Use IT to treat and present information.
23. Work in a team and show concern for interpersonal relations at work.

Content

Unit 1. Introduction. Analytical techniques of separation. Separation processes in Chemistry. Separation in Analytical Chemistry. Fundamentals of separation processes. Classifications.

Unit 2. Introduction to chromatography. Concept Bases chromatographic separations. Classifications. First layer.

Unit 3. Chromatographic parameters. Basic definitions. Retention parameters. Thermodynamic aspects: distribution coefficient. Retention factor (capacity) and selectivity factor. Theory of dishes. Efficiency Kinetic aspects: bandwidth and Van Deemter equation. Resolution Qualitative and quantitative analysis in chromatography.

Unit 4. Chromatography of gases. Principles of gas chromatography. Instrumentation Bearer gas Injectors Columns. Stationary phases Detectors Factors that affect separation and resolution. Gas chromatography - solid (adsorption). Gas-liquid chromatography. Applications for qualitative analysis. Index of Kovats. Derivation. Applications to quantitative analysis.

Unit 5. Liquid chromatography (I). Liquid column chromatography. High resolution liquid chromatography (HPLC). Instrumentation Columns. Detectors Liquid chromatography - liquid (partition). Stations connected: normal phase and reverse phase. Mobile phase: strength and selectivity of the solvent. Applications.

Unit 6. Liquid chromatography (II). Others Liquid-solid chromatographies. Adsorption. Ion chromatography: Ion exchange base and resin converters. Molecular exclusion chromatography.

Unit 7. Separation with supercritical fluids. Characteristics of supercritical fluids. Extraction and chromatography with supercritical fluids. Applications.

Unit 8. The mass spectrometer as a chromatography detector. The mass spectrometer and its characteristics. Gas-mass and liquid-mass interface. Type of ionization. Types of spectrometers. Differences between MS and MSn.

Unit 9. Separation techniques applied to sample treatment. Solvent extraction: Concept. Law of distribution. Simple and successive extraction. Solid phase extraction (SPE): Basic concepts, MIPs. Applications.

Unit 10. Capillary electrophoresis. Concept of electrophoresis. Capillary electrophoresis. Electrosmotic flow and electrophoretic mobility. Instrumentation Capillary electrophoresis zone. Applications.

Methodology

Teaching methodology and training activities

The training activities are divided into three sections: theory classes, problem classes and seminars, each one with its specific methodology.

Theory classes

The teacher will explain the content of the syllabus with the support of audiovisual material that will be available to students in the Virtual Campus of the subject and/or in the related TEAMS team. These lectures will be an important part of the theory section.

Under the guidance of the teacher and through communication through the Virtual Campus, the knowledge of selected parts of the syllabus will have to be searched and studied by means of autonomous learning by the students. In order to facilitate this task, information about locations will be provided in textbooks, web pages, etc.

Solving problem classes

The number of students in problem groups will depend on the teaching plan programmed by the Department of Chemistry.

The dossiers of problem statements of the subject by categorized subjects will be delivered through the Virtual Campus, which will be solved during the face-to-face problem sessions (scheduled in the time schedule prepared by the Coordination of the Degree in Chemistry). In these sessions, problem teachers will present the experimental and calculation principles needed to work on the problems posed, explaining the guidelines for solving them and at the same time reinforcing the knowledge of different parts of the subject of the theory classes.

Seminars

A seminar can be programmed to deal with specific subjects related to the subject's program or to review concepts at the end of the course.

Material available on the Virtual Campus of the subject

Teaching guide

Presentations used by teachers to theory classes

Dossiers of solving problem classes

Calendar of teaching activities (classroom, seminar classes, assessments,...)

Annotation: Within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

Activities

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Seminars	1	0.04	1, 6, 3, 18, 19, 9, 10, 7, 2, 20, 11, 13, 14, 15, 23, 21, 22
Solving problems classes	12	0.48	1, 3, 18, 19, 9, 10, 7, 2, 20, 11, 12, 13, 14, 15, 16, 17, 23, 21, 22
Teaching class	36	1.44	1, 6, 3, 18, 19, 4, 5, 9, 10, 7, 2, 20, 11, 12, 13, 14, 15, 23, 21, 22
Type: Autonomous			
Self study	92	3.68	1, 8, 6, 3, 18, 19, 9, 10, 2, 20, 11, 12, 13, 14, 15, 16, 17, 23, 21, 22

Assessment

The evaluation process follows the principle of continuous evaluation. For the evaluation of the subject, will be performed:

A) Two partial trials on the dates indicated by the faculty, each corresponding to a part of the subject. The weight of each part will come according to the corresponding calendar and each course will be indicated. Usually, the content of the 1st part is never less than 1/3 of the total. Partial trials are individual. Each partial trial will have two parts. The first part will consist of several questions related to the theory part of the subject (it may be a test type and may also include some short questions). In the second part, the student will have to solve some problems. The theory part will be worth between 40-60% of the grade point average, and the problem part between 40-60%. To be able to average for the final grade, the grade of the partial must be equal to or higher than 4.0. The average mark of these two tests must be at least 5.0 and will have a weighting of 70% in the final grade.

B) Cooperative activities or Evidences. These works can be done in groups or individually, and the maximum number of participants will be set before each work. The overall grade for this work will have a weighting of 30% in the final grade.

The final grade for the subject is the sum of the weighted grades from the previous two items. To pass the course, students must obtain a final grade equal to or higher than 5.0.

If the Cooperative Activities or Evidences are not presented, the student will be qualified as "not assessable", regardless of the mark of the partial exams.

Students who do not pass the assessment of the partial trials in section (A) will have an extraordinary assessment on the dates determined by the faculty. In order to be able to take the resit exam, students must have participated in assessment activities throughout the course that are equivalent to 2/3 of the final grade.

Only the note referred to in section (A) can be retrieved. For recovery, the note in section (B) will be the same.

To recover the grade in section (A), the student must present each of the partials with a grade lower than 4.0. In the event that the average mark of the partials is less than 5.0, and the partials both have a mark higher than 4.0, the student may decide to take the extraordinary assessment of both partials or only the extraordinary assessment of that partial that has the lowest mark.

The mark of the resit exam will replace the previous mark in the calculation of the final mark. To be able to average for the final grade, the grade of the partial must be equal to or higher than 4.0.

Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
Cooperative work or Evidences	30%	2	0.08	1, 6, 3, 9, 10, 20, 11, 12, 13, 15, 17, 23, 21, 22
Exam 1st part	35%	2	0.08	1, 8, 3, 4, 5, 9, 10, 7, 2, 14, 16, 17, 21
Exam 2nd part	35%	2	0.08	1, 8, 3, 4, 5, 9, 10, 7, 2, 14, 16, 17, 21
Final Exam	70%	3	0.12	1, 8, 6, 3, 18, 19, 4, 5, 9, 10, 7, 2, 20, 11, 12, 13, 14, 15, 16, 17, 23, 21, 22
