

**Applied Stochastic Processes**

Code: 42253  
ECTS Credits: 6

Degree	Type	Year	Semester
4313136 Modelling for Science and Engineering	OT	0	1

**Contact**

Name: Daniel Campos Moreno

Email: daniel.campos@uab.cat

**Teachers**

Aureli Alabert Romero

Vicenç Mendez Lopez

Alvaro Corral Cano

Daniel Campos Moreno

**Use of Languages**

Principal working language: english (eng)

**Prerequisites**

Calculus of several variables. Ordinary and partial differential equations. Introduction to probability theory

**Objectives and Contextualisation**

The main goal of this course is to provide powerful tools to deal with the analysis and numerical simulations of stochastic processes both for systems affected by external noise or by internal noise. Applications to ecological and biological systems will be discussed in detail.

**Competences**

- Apply logical/mathematical thinking: the analytic process that involves moving from general principles to particular cases, and the synthetic process that derives a general rule from different examples.
- Apply specific methodologies, techniques and resources to conduct research and produce innovative results in the area of specialisation.
- Apply techniques for solving mathematical models and their real implementation problems.
- Conceive and design efficient solutions, applying computational techniques in order to solve mathematical models of complex systems.
- Formulate, analyse and validate mathematical models of practical problems in different fields.
- Isolate the main difficulty in a complex problem from other, less important issues.

**Learning Outcomes**

1. Apply logical/mathematical thinking: the analytic process that involves moving from general principles to particular cases, and the synthetic process that derives a general rule from different examples.

2. Apply specific methodologies, techniques and resources to conduct research and produce innovative results in the area of specialisation.
3. Apply stochastic process techniques to predict the behaviour of certain phenomena.
4. Apply stochastic process techniques to study models associated with practical problems.
5. Identify real phenomena as models of stochastic processes and extract new information from this to interpret reality.
6. Implement the proposed solutions reliably and efficiently.
7. Isolate the main difficulty in a complex problem from other, less important issues.
8. Use specific software to model stochastic processes and, depending on the situation, estimate the corresponding parameters.

## Content

First Part:

1. Elementary probability
2. Stochastic processes. Noise and Markov processes
3. Microscopic description: Stochastic differential equations and their integration. Applications to population dynamics

Second Part:

1. Mesoscopic description: Master equation. One-step processes. Diffusion approach. Biological and physical examples.
2. Random Walks. CTRW. Anomalous diffusion, Lévy flights and First passage-time problems. Ecological and social applications

Third Part:

1. Simulation of stochastic processes. Gillespie algorithm. Tau-leaping method. Reaction-diffusion methods. Next reaction method.

## Methodology

The methodology of the course will combine traditional lectures in the classroom with autonomous activities by the student to practice the concepts seen in the course.

As a novelty, this year the first and the second part of the course (theory and practical applications) will be done intertwined to facilitate the assimilation of the contents.

Annotation: Within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

## Activities

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Classroom sessions	38	1.52	1, 2, 4, 3
Type: Supervised			
Mentoring	9	0.36	5, 6
Type: Autonomous			

Personal work	30	1.2	2, 3, 5
Preparation of assignments	20	0.8	1, 2, 4, 6, 8

## Assessment

The evaluation will be divided into the three parts of the course:

First part. (35%)

There will be a problems assignment (10% of the final mark) and a general exam of this part (25%)

Second part. (35%)

There will be a short project to work with the concepts and techniques seen in the classroom (15% of the final mark) and a short exam of this part (20%).

Third part (30%)

There will be several assignments to work with the numerical and simulation techniques seen in the classroom. (30%)

## Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
Exam of the practical part	20%	1	0.04	1, 4, 3, 8
Exam of the theoretical part	25%	2	0.08	1, 2, 4, 3, 5, 6
Simulations and practical works	55%	50	2	1, 2, 4, 3, 7, 5, 6, 8
