Teaching groups languages

You can check it through this <u>link</u>. To consult the language you will need to enter the CODE of the subject. Please note that this information is provisional until 30 November 2023.

Prerequisites

It is very convenient to have some basic mathematical knowledge for a good development of this subject.

Objectives and Contextualisation

Statistical tools are very important in the field of Biology. Nowadays, the development of Genetics and Genomics require great expertise in Statistics.

The objectives of the course are (1) to master the basic concepts of statistics; (2) to develop the ability to apply these concepts correctly, especially in the problems originated in the life sciences and Genetics; (3) to learn how to communicate effectively the results of a statistical analysis; and (4) to obtain basic skills with some statistical computing programs.

Competències

Apply the scientific method to problem solving. Apply the theoretical knowledge in practice. Know, apply and interpret the basic procedures of mathematical calculation, statistical analysis and basic computer applications, which is essential in genetics and genomics. Learn the basic principles of experimental design and interpretation of results. Design and interpret association studies between genetic polymorphisms and phenotypic characters for the identification of genetic variants that affect such characters, including associations to genetic pathologies and those that confer susceptibility to diseases. Have the ability to analyse and synthesize large amounts of data.

Resultats d'aprenentatge

- 1. Apply the scientific method to problem solving.
- 2. Apply theoretical knowledge to practice.

- 3. Describe the problems associated with multiple statistical comparisons.
- 4. Design experiments and interpret the results.
- 5. Prepare a report on the results of genetic research.
- 6. List the basic statistical principles of quantitative genetics.
- 7. Explain the logic of statistical reasoning and the importance of the randomization of causes.
- 8. Pose a genetic research problem.
- 9. Make decisions.
- 10. Reason critically.
- 11. Capacity for analysis and synthesis.
- 12. Use of statistical packages.

Competences

- Apply knowledge of theory to practice.
- Apply scientific method to problem solving.
- Be able to analyse and synthesise.
- Design and interpret studies associating genetic polymorphisms and phenotypical characters to identify genetic variants that affect the phenotype, including those associated to pathologies and those that confer susceptibility to human illnesses or those of other species of interest.
- Design experiments and interpret the results.
- Know, apply and interpret the basic procedures of mathematical calculation, statistical analysis and IT, the use of which is indispensable in genetics and genomics.
- Make decisions.
- Reason critically.

Learning Outcomes

- 1. Apply knowledge of theory to practice.
- 2. Apply scientific method to problem solving.
- 3. Be able to analyse and synthesise.
- 4. Describe the problems associated to multiple statistical comparisons.
- 5. Design experiments and interpret the results.
- 6. Enumerate the basic statistical principles of quantitative genetics.
- 7. Explain the logic of statistical reasoning and the importance of the randomisation of causes.
- 8. Make decisions.
- 9. Pose a genetic research problem.
- 10. Produce a report on the results of genetic research.
- 11. Reason critically.
- 12. Use statistical packages.

Content

Topic 1: Introduction. Experimental design and statistical inference. Sampling: Biological population, statistical population.

Topic 2: Hyphotesis testing. Elements of a statistical test.

Topic 3: Statistical analysis of one and two samples: Student's t test. Comparison of means. Paired data.

Topic 4: Analysis of variance. I. Model of fixed effects of a factor. Analysis of variance procedure. Tests a posteriori.

Topic 5: Analysis of variance. II. Fixed effects model for two or more factors.

Topic 6: Principles of experimental design. Experimental unit and treatment. Experimental variation (error) and its control. Repetitions. Statistical power and effect size.

Topic 7: Statistical analysis in regression.

Topic 8: Multiple regression.

Topic 9: Analysis of covariance.

Topic 10: Analysis of enumerative data.

Topic 11: Introduction to the design of experiments in genetic epidemiology: Methods of detection of genes involved in diseases: linkage and association studies.

Topic 12: Non-parametric statistics.

Topic 13: Introduction to Bayesian statistics.

Methodology

General introduction to the basic concepts of statistics to understand statistical reasoning and the proper use of statistical tools in the design and analysis of experiments.

Theory classes: The student acquires the scientific knowledge of the subject by attending theory classes.

Classes of problems: The knowledge acquired in the classes of theory are applied to the resolution of practical problems.

Classes of practices: Essential to understand and put into practice the knowledge acquired in theory. The concepts and methods studied are reviewed using statistical packages.

Annotation: Within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

Activities

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Clases de teoria	30	1.2	4, 5, 6, 7, 9
Seminarios de problemas	11	0.44	2, 1, 5, 10, 9, 8, 11, 3
Seminarios de pràcticas	12	0.48	2, 1, 5, 10, 9, 8, 11, 3, 12

Type: Supervised			
Tutorias de grupo	4	0.16	2, 1, 5, 10, 9
Type: Autonomous			
Elaboracion de trabajos	20	0.8	2, 1, 10, 11, 3
Horas de estudio	60	2.4	2, 1, 4, 5, 10, 6, 7, 9, 8, 11, 3, 12

Assessment

Competences of this subject will be evaluated through continuous assessment, which includes written, practical exams and individual works. The evaluation system is organized into 3 modules, each which a specific weight in the final grade.

Theory

Evaluation through two partial tests. The first partial will have a weight of 30% and the second partial will have a weight of 40%. The final test is aimed at students who have not passed some of the partial tests, and their weight in the final grade will be the same as that of each partial test.

Problems

This is carried out by performing short problems in class. The students have to solve and discuss the problems in front of their classmates. This section represents 15% of the final grade of the subject.

Practices

This is carried out through a practical test in the computer room in sessions of one hour for each group. In this practical session, the student must use the appropriate statistical program, enter the data of a study, propose an analysis of it, and answer specific questions. The weight of this test is 15% of the final grade for the subject.

Attendance to practical sessions is mandatory.

To be eligible for the retake process, the student should have been previously evaluated in a set of activities equalling at least two thirds of the final score of the course or module. Thus, the student will be graded as "No Evaluable" if the weigh thin of all conducted evaluation activities is less than 67% of the final score.

Single evaluation

The single assessment will consist of a single exam that includes both theory (with a weight of 70%) and compute The exam for the single assessment will coincide with the date of the tes

Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
Pruebas escritas. Primer parcial	30%	2	0.08	2, 4, 5, 6, 7, 9, 3
Pruebas escritas. Segundo parcial	40%	3	0.12	2, 4, 5, 6, 7, 9, 3
Pruebas prácticas	15%	1	0.04	8, 11, 12
