

**Data Visualisation and Modelling**

Code: 43482  
ECTS Credits: 6

Degree	Type	Year	Semester
4313136 Modelling for Science and Engineering	OT	0	1

## Contact

Name: Pedro Puig Casado

Email: pere.puig@uab.cat

## Teaching groups languages

You can check it through this [link](#). To consult the language you will need to enter the CODE of the subject. Please note that this information is provisional until 30 November 2023.

## Teachers

Maria Rosa Camps Camprubi

Giulia Binotto

Juan Ramon Gonzalez Ruiz

## Prerequisites

An elementary knowledge in Probability Theory and Statistical Inference.

## Objectives and Contextualisation

Course of R All the practical exercises will be solved using the statistical package R. This introductory course is basic for all the posterior developments.

Visualization of large-scale datasets with R GViz, Maps and Tabplot.

Data Simulation, Bootstrapping and Permutation testing These methodologies allow a fast solution to complex statistical models without a deep knowledge of the general and classical statistical topics. They are indispensable tools in the current statistical modelling techniques. The students will complete a basic training program, including the use of an appropriate software, and they will learn how to attack several real data analysis problems.

Bayesian networks, in the opinion of many researchers one of the most significant contribution in AI in this century, are graphical structures for representing the probabilistic relationships among a large number of variables and for doing probabilistic inference with those variables, with a huge number of application fields.

One of the objectives of this course is to introduce them and develop in students some skill in their use in modelling, both from a theoretical and applied point of view, with particular emphasis on the use of appropriate software.

## Competences

- Analyse complex systems in different fields and determine the basic structures and parameters of their workings.
- Analyse, synthesise, organise and plan projects in the field of study.
- Apply logical/mathematical thinking: the analytic process that involves moving from general principles to particular cases, and the synthetic process that derives a general rule from different examples.
- Apply specific methodologies, techniques and resources to conduct research and produce innovative results in the area of specialisation.
- Apply techniques for solving mathematical models and their real implementation problems.
- Conceive and design efficient solutions, applying computational techniques in order to solve mathematical models of complex systems.
- Formulate, analyse and validate mathematical models of practical problems in different fields.
- Isolate the main difficulty in a complex problem from other, less important issues.

## Learning Outcomes

1. Analyse, synthesise, organise and plan projects in the field of study.
2. Apply logical/mathematical thinking: the analytic process that involves moving from general principles to particular cases, and the synthetic process that derives a general rule from different examples.
3. Apply specific methodologies, techniques and resources to conduct research and produce innovative results in the area of specialisation.
4. Apply temporary-series techniques to predict the behaviour of certain phenomena.
5. Apply temporary-series techniques to study models associated with practical problems.
6. Choose the best description of a system on the basis of its particular characteristics
7. Identify the parameters that determine how a system works.
8. Implement the proposed solutions reliably and efficiently.
9. Isolate the main difficulty in a complex problem from other, less important issues.
10. Recognise problems that require the use of temporary-series techniques to build models associated with practical problems.
11. Use specific software to solve optimisation problems..

## Content

Part 1: Introduction to R (6h)

Part 2: Visualization of large-scale datasets with R (6h)

Part 3: Bayesian Networks (14h)

- 1) Block 1: Basics.
- 2) Block 2: Causal networks and Inference in Bayesian networks.
- 3) Block 3: Learning Bayesian network parameters.

Part 4: Data Simulation, Bootstrapping and Permutation testing (12h)

- 1) Permutation tests.

- 2) Jackknife.
- 3) Parametric Bootstrap.
- 4) Non-parametric Bootstrap.

## Methodology

In this course lectures, in which the determining factor is the teacher's explanation, are the basis of the learning process. It is also very important the participation of the students, combined with practical sessions in which it is the student him/herself who must use the knowledge to solve problems.

Annotation: Within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

## Activities

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Exercises	16	0.64	2, 1, 3, 5, 4, 9, 7, 8, 10, 6, 11
Lectures	38	1.52	5, 4, 7, 8, 10, 6
Projects + Assignments	18	0.72	2, 1, 3, 5, 4, 9, 7, 8, 10, 6, 11
Type: Supervised			
Practical sessions	20	0.8	5, 4, 7, 8, 10, 6

## Assessment

The evaluation of the course consists in a continuous assessment.

There are 4 assessments during the course, weighted as 10%, 10%, 40%, 40% corresponding to each part.

Each professor will explain his or her own type of assessment.

Part 1 assessment: Daily homework + final project (individual simple real data analysis with R).

Part 2 assessment: Daily homework + final project

Part 3 assessment: Daily homework + delivery of some exercises + exam.

Part 4 assessment: Daily homework + delivery of some exercises.

## Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
-------	-----------	-------	------	-------------------

Daily homework	50	38	1.52	2, 1, 3, 5, 4, 9, 7, 8, 10, 6, 11
Projects + Exam	50	20	0.8	2, 1, 3, 5, 4, 9, 7, 8, 10, 6, 11
