

**Statistics and Data Analysis**

Code: 44079  
ECTS Credits: 9

Degree	Type	Year	Semester
4313861 High Energy Physics, Astrophysics and Cosmology	OB	0	1

## Contact

Name: Francisco Javier Rico Castro

Email: francisnojavier.rico@uab.cat

## Teaching groups languages

You can check it through this [link](#). To consult the language you will need to enter the CODE of the subject. Please note that this information is provisional until 30 November 2023.

## Teachers

Abelardo Moralejo Olaizola

Carles Sánchez Alonso

Jorge Carretero Palacios

Pau Tallada Crespi

Martin Borstad Eriksen

Francesc d'Assis Torradeflot Curero

## Prerequisites

For the Python Bootcamp (part 2), it is needed to bring a personal laptop with a running installation of Python 3.

Install Python 3 with the Anaconda installer. In this way, your Python distribution will contain all the associated packages needed for this course.

Follow these steps:

1. Download the Anaconda installer for Python 3 here <https://www.anaconda.com/download/>
2. Follow the installation instructions - both GUI or terminal versions work fine. If prompted, select the option to add the new anaconda directory to your path.

The use of GNU/Linux is highly recommended.

## Objectives and Contextualisation

In this course we will learn how to distill scientific knowledge from experimental data, a process that relies on statistical methods. We will learn the basic concepts of Probability and Statistics (in their Frequentist and Bayesian frameworks). In addition, we will study and practice several particular statistical methods and data analysis techniques usually used in the fields of High Energy Physics, Astrophysics and Cosmology. To that aim, we will learn and practice the use of modern statistics and analysis software tools.

## Competences

- Solve problems in new or little-known situations within broader (or multidisciplinary) contexts related to the field of study.
- Use mathematics to describe the physical world, select the appropriate equations, construct adequate models, interpret mathematical results and make critical comparisons with experimentation and observation.
- Use the adequate software, programming languages and computer packages to research problems related to high energy physics, astrophysics and cosmology.
- Work in a group and take on responsibility, interacting professionally and constructively with other people with complete respect for their rights.

## Learning Outcomes

1. Apply data analysis techniques to problems in the areas of particle physics, astrophysics and cosmology, as well as other close but different areas.
2. Learn how statistical analysis software works.
3. Use Monte Carlo techniques to model real problems of physics.
4. Work in small groups to solve problems of data analysis.

## Content

Part 1: Basic concepts on probability, statistics and Monte Carlo techniques

Part 2: Python for Statistics and Data Analysis

Part 3: Parameter estimation, Hypothesis test and Unfolding

Part 4: Bayesian Statistics

## Methodology

- Theory lectures including practical examples in the fields of High Energy Physics, Astrophysics and Cosmology
- Homework exercises to be solved by students alone or in small groups
- Discussion of problems during classes and tutorials
- Hands-on sessions on software tools for statistics and data analysis (in Python programming language)
- Explanation and discussion of sample code/algorithms in Python programming languages during classes and tutorials

Annotation: Within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

## Activities

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Lectures	56	2.24	1, 2, 3
Study of theory and practical examples	64	2.56	1, 2, 4, 3
Type: Autonomous			
Discussion, workgroups, problem solving	60	2.4	1, 2, 4, 3

## Assessment

The evaluation will take into account:

- Attendance and active participation to the lectures
- Resolution of specific exercises along the course
- Resolution of a final exam

For those students not passing the course after the regular evaluation procedure, there will be a *recuperation* evaluation round consisting also on specific exercises for the different course parts, plus a final synthesis exam. There will be no threshold mark to be eligible for the recuperation evaluation round, other than the general requirement of having been evaluated at least for a 66% of the total qualification activities in the first round.

This subject/module does not foresee the single assessment system.

## Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
Attendance and active participation to the lectures	5%	0	0	1, 2, 3
Resolution of a final, synthesis exam	50%	5	0.2	1, 2, 3
Resolution of class exercises	45%	40	1.6	1, 2, 4, 3

## **Software**

We will introduce and make use of the Python programming language (see the "Prerequisites" section for installation details).

In particular, we will study and use the following Python libraries: numpy, pandas, matplotlib, scipy and scikit learn.
