Prerequisites

There are no official prerequisites but knowledge of Genetics and Statistics is presupposed, as well as a basic level of reading comprehension in English.

Objectives and Contextualisation

Population Genetics is the study of genetic differences that occur naturally among organisms. Genetic differences between organisms of the same species are called polymorphisms whereas the differences that have accumulated between different species constitute genetic divergence. Population Genetics is the study of polymorphism and divergence.

Population Genetics is one of the few biological sciences that combine theory, empirical information and experimentation. For this reason it is an enormously formative science. The theory of Population Genetics has developed considerably since the time of Fisher, Haldane and Wright, the founders of this science. In this respect, this course can be considered introductory and the mathematical level necessary to follow the lessons is quite elementary.

The Population Genetics course is in the 2nd year of the Genetics Degree (2nd semester) and aims to provide students with the basic fundamentals of this science. The syllabus of the course consists of several lessons that include: (1) a description of the variation that has been detected in the natural populations through different techniques; (2) an explanation of the expected characteristics in an ideal population of infinite size and random mating; (3) a review of factors influencing the genetic makeup of a population; and (4) a treatment of Molecular Population Genetics which includes an explanation of the Neutralist Theory of Molecular Evolution.

The main training objectives of the subject are: the understanding of the probabilistic aspects of the hereditary transmission in the populations, understanding the origin and maintenance of populations of genetic variation, understanding the effect of the different factors considered on the genetic constitution of populations, as well as the ability to reason and contrast theoretical models through empirical observations and experimentation.

Competences

- Act with ethical responsibility and respect for fundamental rights and duties, diversity and democratic values.
- Analyse and interpret the origin, evolution, diversity and behaviour of living beings.
- Apply statistical and computer resources to the interpretation of data.
- Be able to analyse and synthesise
- Be able to organise and plan.
- Characterise, manage, conserve and restore populations, communities and ecosystems.
- Make changes to methods and processes in the area of knowledge in order to provide innovative responses to society's needs and demands.
- Obtain information, design experiments and interpret biological results.
- Students must be capable of applying their knowledge to their work or vocation in a professional way and they should have building arguments and problem resolution skills within their area of study.
- Students must develop the necessary learning skills to undertake further training with a high degree of autonomy.
- Students must have and understand knowledge of an area of study built on the basis of general secondary education, and while it relies on some advanced textbooks it also includes some aspects coming from the forefront of its field of study.
- Take account of social, economic and environmental impacts when operating within one's own area of knowledge.
- Understand heredity mechanisms and the fundamentals of genetic improvement.
- Work in teams.

Learning Outcomes

1. Apply statistical and computer resources to the interpretation of data.
2. Apply the fundamental principles of genetics to the management of populations to achieve their conservation.
3. Be able to analyse and synthesise.
4. Be able to organise and plan.
5. Correctly interpret results from population genetics studies.
6. Critically analyse the principles, values and procedures that govern the exercise of the profession.
7. Describe the principles of natural and artificial selection.
8. Explain and describe the dynamics of genes in populations across generations.
9. Explain the impact of the different factors in evolutionary change.
10. Identify and explain the forces that modulate the genetic variation of populations when they act in isolation or in unison.
11. Propose new methods or well-founded alternative solutions.
12. Students must be capable of applying their knowledge to their work or vocation in a professional way and they should have building arguments and problem resolution skills within their area of study.
13. Students must develop the necessary learning skills to undertake further training with a high degree of autonomy.
14. Students must have and understand knowledge of an area of study built on the basis of general secondary education, and while it relies on some advanced textbooks it also includes some aspects coming from the forefront of its field of study.
15. Take account of social, economic and environmental impacts when operating within one's own area of knowledge.
16. Work in teams.

Content

GENETIC VARIATION

Lesson 1. Genetic variation
 Lesson 2. Hardy-Weinberg equilibrium
 Lesson 3. Linkage disequilibrium
 Lesson 4. Inbreeding

MECHANISMS OF EVOLUTIONARY CHANGE

Lesson 5. Natural selection
 Lesson 6. Genetic drift
 Lesson 7. Mutation
 Lesson 8. Migration

MOLECULAR POPULATION GENETICS

Lesson 9. Molecular evolution
 Lesson 10. Detection of natural selection

Activities and Methodology

Title	Hours	ECTS	Learning Outcomes
Type: Directed			
Problem-solving seminars	15	0.6	2, 1, 7, 8, 9, 10, 5, 14, 13, 12, 3, 4, 16
Theory classes	30	1.2	15, 6, 2, 1, 7, 8, 9, 10, 5, 11, 14, 13, 12, 3, 4, 16
Type: Supervised			
Individual tutorials	3	0.12	15, 6, 2, 1, 7, 8, 9, 10, 5, 11, 3, 4, 16
Type: Autonomous			
Lesson study	50	2	6, 2, 1, 7, 8, 9, 10, 5, 11, 14, 13, 12, 3, 4, 16
Problem solving	45	1.8	15, 6, 2, 1, 7, 8, 9, 10, 5, 11, 14, 13, 12, 3, 4, 16

Teaching methodology includes three types of activities: theory lessons, problem-solving classes, and tutorial sessions.

Theory lessons will provide the student the basic concepts and information needed to learn autonomously later on. Powerpoint presentations used in class will be available through the Virtual Campus.

Problem-solving classes, which will be done in two reduced groups, will be used to answer questions and learn to reason and apply the acquired knowledge to the resolution of problems. Weekly problems will be available for the student to work on and they will be solved later in class.

Tutorial sessions can be individual or in small groups for those students that wish to do so. They can be done online or in person. These tutorial sessions are useful to gauge the advance in the comprehension of the subject and to provide help with the most difficult concepts.

Annotation: Within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

Assessment

Continuous Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
1st partial exam	35%	3	0.12	15, 6, 2, 1, 7, 8, 9, 10, 5, 11, 14, 13, 12, 3, 4, 16
2nd partial exam	35%	3	0.12	15, 6, 2, 1, 7, 8, 9, 10, 5, 11, 14, 13, 12, 3, 4, 16
Problem assignments	30%	1	0.04	15, 6, 2, 1, 7, 8, 9, 10, 5, 11, 14, 13, 12, 3, 4, 16

The evaluation of the subject will be based on problem assignments and participation in problem-solving seminars (30%), and on exam scores (1st partial exam 35%, 2nd partial exam 35%, recovery of partial exams 70%).

Problem assignments

At certain moments along the course, a list of problems will be delivered to the students to work on their own or in groups. Students must individually submit the solved problems to the teacher through the Virtual Campus. The set of problems turned in by each student will be evaluated and the grade obtained will represent 30% of the final grade.

Exams

There will be a partial examination of the first part of the subject and another partial examination of the second part of the subject. Each partial examination will include a multiple-choice test and problems to be solved by the student. Each of the partial exams will account for 35% of the final score.

Students who pass a partial exam (grade of 5 or higher) will release this part of the subject. Students who get a grade equal to or greater than 4 can compensate (and therefore release the corresponding part of subject) if the average grade with the other partial exam is equal to or higher than 5. Students who fail or do not present themselves to a partial exam, should attend the final exam to pass the subject.

The final exam will follow the format of the partial exams and will also include a multiple-choice test and problems to be solved by the student. The grade obtained in the recovery exam will account for the same weight as the partial exams. In order to calculate the weighted average of the exams and the problem assignments, the student must obtain a minimum score of 4 in the problem assignments as well.

To be eligible for the reexamination process, the student should have been previously evaluated in a set of activities equaling at least two thirds of the final score of the course or module. Thus, the student will be graded as "No Avaluable" if the weighthin of all conducted evaluation activities is less than 67% of the final score.

Single evaluation

The students that choose for the single evaluation option, must do a single exam where all the contents of the course program will be evaluated. The exam will include a multiple-choice test and problems to be solved by the student. The grade of this exam will represent 70% of the final grade of the course. This exam will be on the same date fixed for the last exam of the continuous evaluation option and a reexamination opportunity will apply in the same way that in the continuous evaluation case.

The students that choose for the single evaluation option will have an available set of problemes to be solved. The answers to these problems will be delivered on the same day fixed for the exam. This work will represent the remaining 30% of the final grade of the course.

Bibliography

The basic textbooks for this subject are:

Hartl, D.H. A Primer of Population Genetics. Sinauer (3rd ed.) 2000.
Hamilton, M. D. Population Genetics. Wiley-Blackwell (1st ed.) 2009.
Nielsen and Slatkin. An introduction to population genetics, Sinauer. 2013.

Other useful reference books are:

Hartl, D. H. and A. G. Clark. Principles of Population Genetics (4th ed.) Sinauer. 2007.
Hedrick, P. W. Genetics of Populations (4th ed.) Jones & Bartlett. 2009.
