Prerequisites

There are no prerequisites for this subject.

Objectives and Contextualisation

This subject is taught in the Degree of Biotechnology and within the topic of Experimental Methods. Corresponds to a compulsory subject of the third year (3 ECTS). It is taught to a group of about 80 students.

Advanced Instrumental Techniques, with exclusively theoretical content, is part of a topic where most of the subjects are eminently practical. Experimental Methods aims to enhance the eminently experimental nature of Biotechnology, accentuating its interdisciplinary nature. Hence, it is necessary to know the theoretical bases of the techniques, as well as their application. It is in this context, where the subject of Advanced Instrumental Techniques, defines its training objectives.

Another important aspect that determines the objectives, and especially the contents of this subject, is the existence of a previous one named Basic Instrumental Techniques, which is taught in the first year. Both subjects are complementary and with both, we aim to cover the set of techniques based on chemistry, biology and physics that a biotechnologist student needs to understand.

The general objective is to know the main advanced instrumental techniques that are used in the laboratory and that the student may need throughout their studies and professional activity. This objective can be further detailed in:

- To acquire and understand the theoretical basis of the main advanced instrumental techniques.
- To understand how to apply these techniques in the field of Biotechnology.
- To enhance the student's self-learning capacity. The student must learn to obtain information and acquire the habit of using this information critically.
- To increase the student's interest in the technical aspects of science.

Learning Outcomes

1. CM22 (Competence) Prioritise the instrumentation necessary for the different techniques for the separation and characterisation of biomolecules.
2. CM22 (Competence) Prioritise the instrumentation necessary for the different techniques for the separation and characterisation of biomolecules.
3. CM23 (Competence) Propose strategies for the purification of biomolecules from complex mixtures.
4. CM23 (Competence) Propose strategies for the purification of biomolecules from complex mixtures.
5. KM23 (Knowledge) Recognise the key microscopic characteristics that distinguish prokaryotic cells from eukaryotic cells, and animal cells from plant cells.
6. SM21 (Skill) Use prokaryotic and eukaryotic cell culture techniques and techniques for the manipulation of biological systems.
7. SM21 (Skill) Use prokaryotic and eukaryotic cell culture techniques and techniques for the manipulation of biological systems.

Content

1. Microscopy

Introduction to optical and confocal microscopy: physical foundations, microscopes and sample preparation. Energy transfer by resonance. Photobleaching. Evanescent field. Image analysis techniques.

2. Electromagnetic radiation and its interaction with matter

Interaction of radiation with matter: absorption, emission and dispersion. Electronic absorption spectroscopy: spectroscopic analysis of biopolymers and effects of conformation on absorption. Infrared spectroscopy and its application to biological molecules. Fluorescence emission spectroscopy: basic principles and application to the analysis of biomolecules.

3. Flow cytometry

Basic principles of flow cytometry. Compensation of fluorescence. Cell separation Flow cytometry by image.

4. Techniques for the study of molecular interactions

Determination of binding constants between biomolecules. Isothermal calorimetry and differential scanning calorimetry. Resonance of superficial plasmons. Microscale thermophoresis.

5. Nuclear magnetic resonance spectroscopy.

Basic principles. Spectrum measurement. One-dimensional NMR of macromolecules. Two-dimensional NMR.

6. X-ray crystallography.

Crystals. Growth of crystals Principles of X-ray diffraction by crystals. Determination of macromolecular structures by X-ray diffraction.

7. Experimental design and data analysis

Importance of experimental design. Use of control samples. Treatment of experimental errors. Statistical significance and hypothesis validation. Linear and non-linear regression.

Activities and Methodology

Title	Hours	ECTS	Learning Outcomes
-------	-------	------	-------------------

Type: Directed		
Theoretical classes	22	0.88
Type: Supervised		
Discussion about subject topics	6	0.24
Type: Autonomous		
Study	43	1.72

Master classes. In some topics, problems interspersed with theoretical concepts will be solved to facilitate their understanding.

Depending on the needs of the development of the subject will be scheduled tutorials for the discussion of specific aspects of the subject.

Annotation: Within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

Assessment

Continous Assessment Activities

Title	Weighting	Hours	ECTS	Learning Outcomes
Participation in the Moodle virtual class	10	1	0.04	CM22, CM23, KM23, SM21
Tests	90	3	0.12	CM22, CM23, KM23, SM21

This subject provides for two individual evaluation systems.

Continuous assessment:

Continuous assessment consists of one tests in the Moodle classroom and two multiple-choice tests in which the contents of the entire theory program of the subject will be evaluated.

- The multiple-choice tests have a retake option and a weight of 9 (5+4) out of 10 of the overall grade. It does not have a minimum grade.

- The participation in the Moodle classroom weight of 1 out of 10 in the overall grade. It has no minimum grade and no retake assessment.

-In the event that you want to improve your grade of the multiple-choice tests, this will be done on the day on which the retake is called. However, retaking the test implies the waiver of the previously obtained qualification.

- To participate in the retake of the multiple-choice tests, students must have previously been evaluated in a set of activities whose weight is equivalent to a minimum of two-thirds of the total grade of the subject or module. Therefore, students will obtain the grade of "Not Assessed" when the evaluation activities carried out have a weighting of less than 67% in the final grade.

- To pass the subject, it is necessary to obtain an overall grade equal to or greater than 5 points out of 10.

Single assessment:

- The single assessment consists of a single multiple-choice test in which the contents of the entire theory program will be evaluated. The grade obtained in this final exam will account for 100% of the final grade of the subject.
- To pass the subject, it is necessary to obtain an overall grade equal to or greater than 5 points out of 10.
- The single assessment test will be held on the same day, time and place as the multiple-choice test of the continuous assessment of the subject.
- The retake consists of a single multiple-choice test in which the contents of the entire theory program will be evaluated. The retake of the single assessment will be carried out on the same day, time and place as the retake of the continuous assessment.
