Prerequisites

Fundamental pre-grade knowledge in Algebra, Differential Calculus, Chemistry and Biochemistry.

Good comprehension of English written scientific publications and textbooks

Basic computer user skills (Windows, Word, Excel,...).

Be enrolled (or have passed in case of retaking students) the Systems Biology module included in Integrated Laboratory VI.

Objectives

Systems biology is a rapidly evolving field which fosters a new approach to solve biological problems through a combination of experimental data and the use of computer models with both predictive and explanatory power. The systems biology approach is centered in the integrated study of the network components (genes, enzymes, metabolites,...) and their interactions, revealing key emerging properties and complex dynamic behavior.

Historically, although it might be argued that the concept is much older, the systems biology approach evolves as a response to the enormous data accumulation from genomics, proteomics, transcriptomics, metabolomics,... and also due to the exponential increase in computer power allowing to go further in the analysis, interpretation and deeper understanding of the 'omics' data.

The first objective of the course will be to review the motives and origins of the discipline while offering a perspective of its relevance in the near future.

The second objective is to introduce the student to the tools and methods most commonly used. Thus the course will evolve from the mathematical description of the system, through the alternative methods of solution, towards the analysis of the resulting behavior. As a result the student will know and be able to use the most frequent basic tools used nowadays in the field.

The third objective will be to apply the acquired knowledge to model systems of the three most studied subsystems, namely metabolic, genetic and signal transduction networks. The emerging dynamics of those systems allows to see the main traits that arise in complex systems and understand the necessity of the 'systems' approach. An important part of this objective is performed as practical computer simulation sessions included in the Integrated Laboratory VI.

The fourth objective includes a firsthand appreciation of how this new approach is being applied in present day research. To this purpose the students will review real examples from scientific literature. Part of this objective will be fulfilled as a team work including the presentation of a reviewed paper to the rest of the students. This activity will favor a deeper understanding of the concepts learned, foster a wider view of its real impact as well as promoting the development of the student communication skills.

The subject is presented gradually, advancing from the basic concepts towards the description of more complex systems allowing for a thorough understanding of the necessity to study systems as integrated units.

The general objective is to allow the student to acquire the systems perspective of today's biology.

Learning outcomes

- CM27 (Integrate knowledge about the organisation, structure and study methods of genomics for the resolution of complex biological problems.) Integrate knowledge about the organisation, structure and study methods of genomics for the resolution of complex biological problems.
- CM28 (Evaluate the biological and biomedical relevance of the findings derived from the analysis of genomic, omics and variability data.) Evaluate the biological and biomedical relevance of the findings derived from the analysis of genomic, omics and variability data.
- KM22 (Describe experimental technologies and methods for structural and functional analysis of genomes and other omics.) Describe experimental technologies and methods for structural and functional analysis of genomes and other omics.
- SM25 (Use bioinformatics tools and databases for the management and analysis of genomic and sequencing data.) Use bioinformatics tools and databases for the management and analysis of genomic and sequencing data.
- SM27 (Apply functional omics analysis strategies for the investigation of gene expression and protein function.) Apply functional omics analysis strategies for the investigation of gene expression and protein function.

Contents

1.- Introduction and definitions

1.1 The 'systems' perspective

1.2 Key general concepts. Emergence and robustness.

2.- Systems description and study

2.1 Top-down vs bottom-up approximations

2.2 Timescales

2.3 Deterministic vs. stochastic approaches

2.4 Dynamics vs steady state

3.- Review of fundamental mathematical concepts

3.1 Balance equations. Structure,

3.2 Kinetics and thermodynamics

3.3 Introduction to system dynamics

3.4 Parameter determination

4. Networks and biological systems

4.1 Networks and genetic circuits

4.2 Metabolic networks in steady state

4.3 Metabolic control analysis

4.4 Signal transduction networks

5.- Systems Biology application examples

Learning activities and methodology

Title	Hours	ECTS	Learning outcomes
Study, review references, , ...	44	1.76	CM27, CM28, KM22, SM25, SM27
Team work	19	0.76	CM27, CM28, KM22, SM25, SM27
Theoretical lessons	30	1.2	CM27, KM22
Solve exercises individually with or without a computer	34	1.36	KM22, SM25, SM27
Seminars and problem solving sessions	15	0.6	CM27, CM28, SM25, SM27
Support sessions to individual or team work	2	0.08	

Along the learning process, the teaching methodology will be fundamentally based on the student's work and the professor will guide the student either in the process of acquisition and interpretation of the most relevant information as well as in the student's personal work. In this context, and according to the learning objectives of the course, the type of learning activities will include theory classes, exercise and problem solving classes, practical computer exercises and tutor sessions.

Theory classes: Were the main basic conceptual topics and the most relevant information will be provided so that the student can develop its autonomous learning. Computer slides (ppt or pdf format) will be available to the student in the virtual campus.

Seminar and problem solving sessions: These sessions will be done in a reduced subgroup of students of the class. Exercises, previously provided, will be explained and/or solved so that they contribute to learn and clarify the knowledge provided along the course. In those sessions, the students will also explain their peers the solution proposed and the pathway and difficulties encountered while solving them, so that the experience is shared among all of them. The exercises will be delivered through the virtual platform before the exercises are solved in class.

Team work: The students will develop a short essay based on a scientific publication of the field and will

present it to their peers in class. This activity provides the opportunity to personally contribute for example by doing some directly related genetic, metabolic or signal transduction computer simulations. This information can be included in the tests to assess the student's learning progress.

Practical computer sessions: Part of the learning outcomes will be acquired through practical computer sessions. Those sessions are formally included in the Molecular Systems Biology module within Integrated Laboratory VI and therefore evaluated separately. Nevertheless they are necessary to achieve the learning outcomes of this topic. Those practical sessions will be done using ad-hoc software. Those exercises will allow the student to become familiar with the models and type of data most common in the field and their use. Those exercises will be done using existing free software.

Tutoring: It will be possible to perform a couple of tutor sessions, if it is requested by the students. The main objective will be to solve doubts, review basic concepts or guide in the process of selecting additional sources of information.

Annotation: within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

Assessment

Continuous assessment activities

Title	Weight	Hours	ECTS	Learning outcomes
Team work	25%	0	0	CM27, CM28, KM22
Active participation	5%	0	0	KM22, SM25, SM27
Progress test	45%	6	0.24	CM27, CM28, KM22, SM25, SM27
Solving exercises	25%	0	0	KM22, SM25, SM27

Continuous assessment of the student's acquired skills, competences and learning outcomes, will be based on the collection of the following evidences:

- Exercises solved (25%)

Along the course, the student will perform a series of exercises, either manually as well as using a computer, which will subsequently be solved in class by one of the students. Those exercises will be provided by each student along the course before being solved in class. Should the exercises not be provided along the course, the mark of this part will be penalized with a decrease of up to 20 % of the qualification of the exercises. At the end of the course one more list of evaluable exercises will be delivered, which can be done in class, accounting for 80% of the exercises mark.

- Team work (25%)

Students will have to perform a teamwork based on a scientific publication on Systems Biology. The team, composed of a small number of members, will review the selected paper and if relevant, will attempt to reproduce any computer simulations using the corresponding free software. The work will also be presented to the rest of the students by all the team members. One of the main objectives of this part will be to transmit the information and knowledge gained by the group to the rest of the students. With the purpose to evaluate the level of success in transferring that information, the rest of the students will evaluate the received information using an evaluation rubric. Therefore, not attending the presentation of the other students will be penalized proportionally to the number of missed presentations. Also, failing to provide personal assessment of the viewed presentations in the proposed format will result in a 10% penalty in the mark of the presented work. Nevertheless, the presented information can also be evaluated at the progress test or at the final examination.

- Progress tests (45%)

As part of the continuous evaluation, several tests will be performed in class along the course, during the calendar foreseen class hours, to assess the student's progress in achieving the learning outcomes. Should the student not perform at least 80% of such tests or reach a qualification below 3.5, the student will have to perform a final test covering all the subjects of the course.

- Active participation (5%) The professorship will assess the active participation in seminars, problem solving classes or any other class activity.

Any evidence part of the continuous evaluation procedure accounting for less or equal the 20% of the final mark will not be reprogrammed and considered non recoverable.

Alternatively

Final examination/Retake (only if continuous evaluation is failed) (100%): Optionally, if the student shows insufficient progress, does not reach the minimum average evaluation level in the progress tests, or if is repeating the semester course, exists the possibility of taking a Final Exam/Retake including all the topics of the course. To be eligible for the retake process, the student should have been previously evaluated in a set of activities equalling at least two thirds of the final score of the course or module. It must be taken into account that if the student takes this option any previous qualification, deriving from the continuous evaluation activities, will be discarded and not considered furthermore.

Students passing the course by means of this exam will not be considered for the Excellent with honour qualification

Unique Evaluation

Students approved by the faculty to take this evaluation mode will have to present on the same day all the necessary evidences to pass the course. Those evidences will be:

Synthesis exam (60%) : This will consist of a written examination including all the subjects of the course (Theory, exercises, presentations,...).

Exercises solved (20%): The day of the exam the student will provide an exercise equivalent to the ones provided for the evaluation of the continuous evaluation mode.

Scientific publication work (20%): The student will perform a written work based on a scientific publication, following the same constraints as for the team work in the continuous evaluation, but performed individually. The day of the exam, the student will present a written summary of the work and give an oral presentation of 15 minutes on the same work.

This exam will be taken on the same date as for the last exam of the continuous evaluation and will be subject of the same method of review and recovery as for the continuous evaluation.

Students passing the course with this exam will not be considered for the Excellent with honour qualification.

Other aspects:

- No Avaluable (not evaluated): Any student not performing at least 80% of the evaluation activities described previously will be qualified as 'No Avaluable'. Also any student not reaching the minimum average qualification in the progress tests and not taking the Final Exam/Retake, will be qualified as 'No Avaluable'.

- Review of grades: both for the unique or the continuous assessment, the teacher will inform the students of the day/time/place of the review of the tasks subject of assessment.

- Matrícula de honor (MH). Excellent with honor or special mention. Grant a qualification with honor is a personal decision of the professorship responsible of the course. UAB regulations specify that an MH can only

be given to students with a final qualification equal or above 9.00 but the professorship can fix a higher minimum level if there are more candidates than the maximum number of honors available, or request complementary activities. Furthermore, this qualification can only be given up to a 5% of the total number of students enrolled in the course.

- Calendar: The dates of any evaluation activity and those of delivery of the team work will be given during the first class of the course. Those dates could be changed as a result of schedule reorganization or an adaptation to any unknown event at this time. Those changes will always be communicated through the virtual platform (Moodle) as it is understood as the main communication channel between students and professors.

- Plagiarism: Irrespective of any other measure that may be adopted, and according to the actual academic regulations, any irregular action (academic fraud, plagiarism or unauthorized use of AI, except explicitly authorized) committed by a student resulting in a variation of the result of any evaluation activity, will receive a qualification of zero. Therefore, to copy or let any other one to copy, or unauthorized use of AI during a test, and exercise or a practical activity will result in its failure. Should this activity be necessary to pass the course, the complete course will not be passed. Any activity qualified this way cannot be recovered. Therefore the complete course will be failed without the opportunity to pass it during the same semester.

- Use of AI, Restricted Use: In the course, the use of Artificial Intelligence (AI) technologies is permitted exclusively in tasks where it is explicitly indicated. For example, in the preparation of the assignment on a scientific paper. The student must clearly identify which parts were generated using this technology, specify the tools used, and include a critical reflection on how these influenced the process and final outcome of the activity. A lack of transparency in the use of AI in this assessed activity will be considered academic dishonesty and may result in partial or total penalties to the activity grade, or more serious sanctions in severe cases. The use of AI is not permitted in other assessed tasks.
