Group languages

You can consult this information at the [end](#) of the document.

Prerequisites

It is not obligatory to have taken any course previously. In any case, in order to take this course, it is necessary:

- Written and oral communication skills in Spanish and Catalan;
- Intermediate level of Catalan, Spanish and English, which allows written and auditory comprehension in the three languages, and
- Intermediate level of office automation -MS Office or other free softwares - especially in managing spreadsheets, texts and presentations.

Objectives

The course has a dual objective. On one hand, it aims to provide basic knowledge about the economic, social, and territorial context in which energy and resource management systems operate in advanced societies. On the other hand, the course also aims to acquaint students with different instruments and mechanisms for resource management and planning.

Regarding the first objective, the course starts with an introductory approach to the socioeconomic and territorial elements that affect systems with a high level of technical complexity, such as energy and resources. Thus, it is considered that the configuration and evolution of these systems are not solely due to technical or technological components but are clearly conditioned by various issues such as the legal and administrative

framework, the impositions and requirements of the urban and territorial environment in which they operate, the economic structure of each sector, the geopolitical framework and the functioning of the global economy, consumption patterns and population demands, or the level of societal awareness of the impacts of this consumption. In this regard, understanding the logic of these socioeconomic and territorial elements is fundamental to interpreting the development possibilities of a particular energy or resource model successfully. This first objective is addressed in the first part of the course, which mainly focuses on the energy area to thoroughly address each of these issues. Thus, after a geographical and historical contextualization of energy, the components of an energy system are detailed, followed by a description of the functioning of energy markets based on the three main groups of agents that integrate them: suppliers, consumers, and the administration. Finally, some of the impacts of the current energy model on our society are described, and solution proposals based on planning are provided.

As for the second objective, acquiring a global vision of environmental management will provide students with fundamental concepts of sustainability, as well as mechanisms and public policies to promote sustainable behaviors at all levels. Methods for measuring sustainability and their application in resource management will be introduced.

Learning outcomes

- CM11 (Relate the acquired knowledge and skills of urban management and planning with those of other technicians in interdisciplinary teams.) Relate the acquired knowledge and skills of urban management and planning with those of other technicians in interdisciplinary teams.
- KM16 (Analyse the urban environment from the point of view of the Circular Economy and Sustainability.) Analyse the urban environment from the point of view of the Circular Economy and Sustainability.
- SM16 (Use quantitative and qualitative techniques for the study, modelling and planning of energy systems, mobility and regional planning.) Use quantitative and qualitative techniques for the study, modelling and planning of energy systems, mobility and regional planning.

Contents

Block 1: Environmental Management

- Limits to growth
- Sustainability
- Hydrosocial Cycle
- Tools (mandatory and voluntary) to improve sustainability

Block 2: Energy

- Geographical context of energy
- Historical context of energy
- Energy systems: definition, components and requirements
- The role of the Administration and Planning: the EU, the State, the regional and local governments
- Energy supply: petroleum products, natural gas and electricity
- The functioning of the market for gas, electricity and petroleum fuels
- Energy consumption: characteristics and determinants
- Territorial and social conflicts
- Energy transition

Learning activities and methodology

Title	Hours	ECTS	Learning outcomes
Conducting practical exercises	30	1.2	CM11, KM16, SM16

Oriented readings	10	0.4	KM16
Lectures	30	1.2	KM16, SM16
Information search	6	0.24	KM16, SM16
Classroom exercises (practical)	30	1.2	KM16, SM16
Reading and individual study	10	0.4	KM16, SM16

The subject will be structured around two main classroom activities, theory classes and practical exercises. The practical exercises, carried out with a computer, will provide the students opportunity to practice how to look for information, and select, treat, analyse and represent data on the subjects explained in the theory class. It is aimed to follow the evolution of each student in the understanding and use of the tools applied in the subject.

Apart from the directed activities, the students will have to spend time outside the classroom to complete those practical exercises not finished in classes, as well as to carry out the recommended readings for each topic.

During the theory classes, students will ask open-ended questions that will allow them to demonstrate their creativity, initiative and sensitivity towards social and environmental issues (T02).

In order to carry out the practical exercises successfully, innovative and competitive proposals must be generated in the professional activity (T03). At the same time, the realization of practical exercises will allow to generate proposals to prevent and to solve problems, adapting to unforeseen situations and to take decisions (T04).

Annotation: Within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

Annotation: within the schedule set by the centre or degree programme, 15 minutes of one class will be reserved for students to evaluate their lecturers and their courses or modules through questionnaires.

Assessment

Continuous assessment activities

Title	Weight	Hours	ECTS	Learning outcomes
Practices energy	40%	25	1	KM16, SM16
Exam Energy Block	30%	2	0.08	SM16
Practices environmental management	15%	6	0.24	CM11, KM16, SM16
Exam Environmental Management Block	15%	1	0.04	SM16

All the official communication related to the subject between professors and students will be made through moodle

The evaluation of the course will be carried out progressively and continuously throughout the semester. The evaluation system is based on the following learning evidences:

- The presentation of reports, both written and oral, related to computer practices, problems, or case studies worked on during the course, with the objective of tracking each student's progress in understanding and using the tools covered in the course. The presentation of reports will allow us to assess the ability to generate innovative and competitive proposals in professional activities (T03) as well as the ability to prevent and solve problems by adapting to unforeseen situations and making

decisions (T04). (The practice includes both group and individual work which will be indicated to students in each class.)

- A partial exam and a final exam (in case of re-evaluation), to support the consolidation of all the material covered during the course.

Evaluation Criteria

The final grade will be calculated based on the two partial exams and the practical work.

Final Grade = Environmental Module Grade (30%) + Energy Module Grade (70%)

In grading exams and reports, aspects such as presentation of the exam, writing quality, and basic errors will be considered, adjusting, if necessary, the final grade obtained from the weighted average of each score.

In order to calculate the weighted sum for the final note, it is necessary to have all the practical work submitted with average grade equal to or greater than 5 and each exam grade must be equal to or greater than 5. It is important to note that the practical work must be completed and submitted on the dates specified by the course instructor. The students who are qualified as Fail for not having achieved the abovementioned condition will receive the minimum grade of 3.

The date of the revision will be communicated to students via Moodle. Ideally the date will be set within 2 weeks from the exam date.

Re-evaluation

For students who, at the end of the evaluation process, have not obtained a grade equal to or greater than 5 on the exams but have a grade higher than 5 on the practical work, there will be a re-evaluation. This will consist of an exam, scheduled by the Faculty in the last week of the semester, representing the situations covered during the course. Students will only have to retake the theoretical part they did not pass in the midterm exams. Practice assignments may be resubmitted if necessary to achieve an average practical-work grade higher than 5. For repeat students, the theory grade for the parts passed will not be carried over to the next year. However, the practical work grade will be carried over from one year to the next.

The maximum grade for the re-evaluation is a 7.

With honors

Awarding an honors mark (MH) is the decision of the faculty responsible for the subject. UAB regulations indicate that MHs may only be awarded to students who have obtained a final grade equal to or greater than 9.00. Up to 5% MH of total enrolled students can be awarded.

Not eligible for evaluation

A student who has not taken an exam is considered "non-assessable". Otherwise, the evaluation criteria detailed above are followed.

Plagiarism or irregularities in the evaluation of the subject

Without prejudice to other disciplinary measures deemed appropriate, and in accordance with current academic regulations, irregularities committed by a student that may lead to a variation of the grade in an evaluable activity will be graded with a zero (0). Evaluation activities rated in this manner and by this procedure will not be recoverable. If it is necessary to pass any of these evaluation activities in order to pass the course, this course will be suspended directly, without the opportunity to recover it in the same course. These irregularities include, among others:

- the total or partial copy of a practice, report, or any other evaluation activity;
- allow copying;
- present a group work not done entirely by the members of the group (applied to all members, not just those who have not worked);

- present as their own materials produced by a third party, even if they are translations or adaptations, and in general work with elements that are not original and exclusive to the student;
- have communication devices (such as mobile phones, smart watches, camera pens, etc.) accessible during individual theoretical-practical assessment tests (examinations);
- talk to colleagues during individual theoretical-practical assessment tests (examinations);
- copy or attempt to copy other students during theoretical-practical assessment tests (examinations); - use or attempt to use subject-related writings during the theoretical-practical assessment tests (examinations), where these have not been explicitly permitted.

In case of not passing the subject due to the fact that some of the evaluation activities do not reach the minimum required grade, the student will be graded the lowest value between 4.5 and the weighted average of the grades. Students who do not participate in any of the evaluation activities will be awarded the grade of "Not Evaluable", and also "Not Evaluable" is given to those that have grade lower than 3.0 and the weighted average of the grades, in case the student has committed irregularities in an evaluation act (and therefore there will not be any compensation or recovery exam for this case). In future editions of this subject, the student who has committed irregularities in an act of evaluation will not validate any of the evaluation activities carried out.

In summary: copying, letting copy or plagiarize (or attempting to) in any of the evaluation activities result in a SUSPENSE, not compensable and without validation of parts of the subject in subsequent courses.

Use of AI

Restricted use: For this subject, the use of Artificial Intelligence (AI) technologies is permitted exclusively in support tasks, such as bibliographic or information searches, text correction or translations. The student must clearly identify which parts have been generated with this technology, specify the tools used and include a critical reflection on how these have influenced the process and the final result of the activity. The lack of transparency in the use of AI in this assessable activity will be considered a lack of academic honesty and may lead to a partial or total penalty in the grade of the activity, or greater sanctions in serious cases.

This subject does not provide for the single evaluation system.
