Abstract

This paper deals with the following problem:
Let \( T \) be a given operator. Find conditions on \( v(x) \) (resp. \( u(x) \)) such that

\[
\int |Tf(x)|^p u(x) dx \leq C \int |f(x)|^p v(x) dx
\]

is satisfied for some \( u(x) \) (resp. \( v(x) \)).

Using vector-valued inequalities the problem is solved for: Carleson’s maximal operator of Fourier partial sums, Littlewood-Paley square functions, Hilbert transform of functions valued in UMD Banach spaces and operators in the upper-half plane.

Introduction

This paper deals with the following

Problem A. Let \( T \) be a given operator. Find conditions on \( v(x) \) (resp. \( u(x) \)) such that

\[
\int |Tf(x)|^p u(x) dx \leq C \int |f(x)|^p v(x) dx
\]

is satisfied for some \( u(x) \) (resp. \( v(x) \)).

This problem was studied for different operators in \([C, J], [G, G], [H, M, S]\). The operators treated were singular integrals, fractional integrals, Hardy-Littlewood maximal operator and fractional maximal operator. In all the cases the method used was constructive.

(*) Partially supported by DGICYT. PB90-187.
On the other hand it was known that a "good" weighted norm inequality of type (0.1), for an operator $T$, gives a vector-valued inequality of type

\[(0.2) \quad \|\left(\sum_{j} |Tf_j|^p\right)^{1/p}\|_s \leq C\|\left(\sum_{j} |f_j|^p\right)^{1/p}\|_s.\]

For instance, the vector valued inequalities for the Hardy-Littlewood maximal operator, $M$, were obtained in [F, S] from the estimate

\[
\int |Mf|^p u \leq C \int |f|^p Mu, \quad 1 < p < \infty.
\]

In 1981, José Luis Rubio de Francia showed that weighted norm inequalities and vector valued inequalities were equivalent in some sense, see [R de F, 1]. Using that equivalence, he developed a non constructive method in order to solve the Problem A for some operators.

The aim of this paper is to show that a slight generalization of the method of Rubio de Francia allows us to solve the Problem A for a huge family of operators. The generalization is two fold:

First we shall consider vector-valued versions of inequality (0.1) and we shall prove the relation with the corresponding inequality (0.2), see Theorem (1.1). We use this vector-valued version in order to:

(a) solve partially Problem A for Carleson’s maximal operator of Fourier partial sums, see Theorem (2.9).

(b) find conditions on $v(x)$ (resp. $u(x)$) such that

\[
\int_{\mathbb{R}} \|Hf(x)\|^p_{E} u(x)dx \leq C \int_{\mathbb{R}} \|f(x)\|^p_{E} v(x)dx
\]

is satisfied for some $u(x)$ (resp. $v(x)$), where $H$ is the Hilbert transform and $E$ is a U.M.D. Banach space, see Theorem (2.24).

In the case that $E$ is a U.M.D. Banach lattice we solve the same problem for the operator

\[
\tilde{M}f(x) = \sup_{x \in Q} \frac{1}{|Q|} \int_{Q} |f(y)|dy, \quad x \in \mathbb{R}^n
\]

where $|.|$ is the absolute value in $E$ and the supremum is taken in the lattice order, see Theorem (2.26).

(c) solve Problem A for Littlewood-Paley square functions, see Theorem (2.11).
The second generalization is to consider abstract measure spaces, instead of \( \mathbb{R}^n \). With these ideas we are able to solve Problem A for operators which map functions in \( \mathbb{R}^n \times [0, \infty) \) into functions in \( \mathbb{R}^n \times (0, \infty) \), see Theorems (2.16) and (2.17). The vector-valued inequalities obtained in this case, see Theorem (3.16), can be of independent interest when working with operators acting on functions defined on the upper half plane. These operators include as particular cases Poisson integrals, balayages, see (2.19), and some well known maximal operators, see (2.23).

Our method gives in all the cases some extra information about the size of the weight that is found.

It is an honour for us to use ideas of our friend and advisor José Luis.

Throughout this paper we shall work on general measure spaces \((Y, d\nu), (X, d\mu)\), where \(d\nu\) and \(d\mu\) are positive measures. Given a Banach space \(E\), we shall denote by \(L_E^p(Y, d\nu)\), \(L_E^p(Y)\) or \(L_E^p(d\nu)\) the Bochner space of \(E\)-valued strongly measurable functions such that

\[
\int_Y \|f(x)\|_E^p d\nu(x) < +\infty.
\]

Given a positive measurable function \(w(x)\), on \((Y, d\nu)\), we shall denote by

\[
L_E^p(w(x) d\nu(x)),
\]

or \(L_E^p(w)\) the space of \(E\)-valued strongly measurable functions such that

\[
\int_Y \|f(x)\|_E^p w(x) d\nu(x)
\]

is finite.

Given a Banach space \(E\), we shall denote by \(\ell_E^p\), or \(\ell(E)\) the Banach space

\[
\{\{\alpha_n\} \subset E : \sum_{n=1}^{\infty} \|\alpha_n\|_E^p < +\infty\}.
\]

If \(E\) is a Banach lattice we shall denote by \(E(\ell^{\infty})\) the lattice

\[
\{\{x_n\} : \sup_n |x_n| \in E\}
\]

with the norm \(\|\{x_n\}\|_{E(\ell^{\infty})} = \|\sup_n |x_n|\|_E\).

The organization of the paper is as follows: in Section 1 we state and prove the abstract results that generalize the previous work of Rubio de Francia, in Section 2 we give (without proof) the applications that solve Problem A for several operators and Section 3 is devoted to the proofs.
1. Abstract results

We begin this section with a lemma, that it is known for the scalar case, see [GC, R de F, VI.4.2]. The proof in the vector-valued case is essentially the same, but we include it here for the sake of completeness.

\((1.0)\) Lemma. Let \((Y, dv)\) be a measure space, let \(F\) and \(G\) be Banach spaces. Assume that \(0 < s < p < \infty\) and \(T\) is a sublinear operator which satisfies

\[
\|\left(\sum_{j} \|Tf_j\|_{F}^{p}\right)^{1/p}\|_{L^{s}(Y, dv)} \leq C\left(\sum_{j} \|f_j\|_{G}^{p}\right)^{1/p}.
\]

Then, if \(\sigma = (\frac{s}{p})'\), there exists a nonnegative function \(w(x)\) with \(\|w\|_{L^{s-1}(Y, dv)} \leq 1\) and such that

\[
\int_{Y} \|Tf_j(x)\|_{F}^{p}w(x)dv(x) \leq C\|f_j\|_{G}^{p}.
\]

The proof of this lemma is based in the following result, see [GC, R de F].

Mini-max Theorem. Let \(A, B\) be convex sets in some vector spaces and assume that \(B\) is compact for a certain topology. Let \(\phi\) be a function, \(\phi : A \times B \to \mathbb{R} \cup \{+\infty\}\), which is concave on \(A\) and convex and lower semicontinuous on \(B\). Then

\[
\min_{b \in B} \sup_{a \in A} \phi(a, b) = \sup_{a \in A} \min_{b \in B} \phi(a, b).
\]

Proof of the lemma (1.0): Let \(A\) and \(B\) given by

\[
A = \{\sum_{j} \|Tf_j\|_{F}^{p} : f_j \in G, \sum_{j} \|f_j\|_{G}^{p} \leq 1\}
\]

\[
B = \{b \in L^{s}(Y) : b(x) \geq 0, \|b\|_{s} \leq 1\}
\]

and we define on \(A \times B\) the function \(\phi\) as

\[
\phi(a, b) = \int_{Y} \sum_{j} \|Tf_j(x)\|_{F}^{p}b(x)^{-\sigma'}dv(x),
\]

\(B\) is convex and weakly compact, \(A\) is convex; \(\phi\) is convex and lower semicontinuous in \(B\), see VI.4.3 in [GC, R de F], and \(\phi\) is linear on \(A\), therefore by the Minimax Theorem we have,

\[
\min_{b \in B} \sup_{a \in A} \phi(a, b) = \sup_{a \in A} \min_{b \in B} \phi(a, b) \leq \sup_{a \in A} \left(\sum_{j} \|Tf_j\|_{F}^{p}\right)^{1/p}\|\sum_{j} \|f_j\|_{G}^{p}\|_{L^{s}(Y, dv)} \leq C^{p}.
\]
Therefore, there exist $b_0 \in B$ such that, for every $a \in A$, we have
\[
\int \sum_j \|Tf_j(x)\|_F^p b_0(x)^{-\sigma'} \, d\nu(x) \leq C^p,
\]
the proof of the lemma finishes by choosing $w(x) = b_0(x)^{-\sigma'}$. ■

(1.1) Theorem. Let $(Y, d\nu)$ be a measure space, $F$ and $G$ be Banach spaces, and \( \{A_k\}_{k=0}^{+\infty} \) be a sequence of disjoint sets in $Y$ such that $\bigcup_{k=0}^{+\infty} A_k = Y$. Assume that $0 < s < p < \infty$ and $T$ is a sublinear operator which satisfies
\[
\| \sum_j \|Tf_j\|_F^p \|_{L^s(A_k, d\nu)} \leq C_k \left( \sum_j \|f_j\|_G^p \right)^{1/p}, \quad k \in 0, 1, ...
\]
where for each $k$, $C_k$ is a constant depending on $G, F, p$ and $s$.

Then there exists a positive function $u(x)$ on $Y$ such that
\[
(1.3) \quad \left( \frac{1}{Y} \int |Tf(x)|^p u(x) d\nu(x) \right)^{1/p} \leq C \|f\|_G
\]
holds, where $C$ is a constant depending on $G, F, p$ and $s$.

Moreover, given a double sequence $\{a_k\}_{k=0}^{+\infty}$ such that $\sum_{k=0}^{+\infty} a_k^p < +\infty$ and $\sigma = (\frac{p}{s})'$, $u$ can be found such that
\[
\|u^{-1} \mathcal{X}_{A_k}\|_{L^{s'}(A_k, d\nu)} \leq (a_k^{-1} C_k)^p.
\]

Proof: Given $k$, we define the operator $T_k$ by
\[
T_k f(x) = Tf(x) \mathcal{X}_{A_k}(x), \quad x \in A_k.
\]
$T_k$ satisfies
\[
\| \sum_j \|T_kf_j\|_F^p \|_{L^s(A_k, d\nu)} \leq C_k \left( \sum_j \|f_j\|_G^p \right)^{1/p},
\]
then by lemma (1.0), there exists a nonnegative function $w_k$ defined on $A_k$ such that $\|w^{-1}\|_{L^{s'}(A_k, d\nu)} \leq 1$ and
\[
\int_{A_k} \|T_kf(x)\|_F^p w_k(x) d\nu(x) \leq C_k^p \|f\|_G^p.
\]
We define \( u(x) \) by
\[
u(x) = \sum_{k=0}^{+\infty} a_k C_k^{-p} w_k(x) X_{A_k}(x), \quad x \in Y;
\]
then
\[
\int_Y \| T f(x) \|_p^p u(x) d\nu(x) = \\
= \sum_{k=0}^{+\infty} a_k C_k^{-p} \int_{A_k} \| T_k f(x) \|_p^p w(x) d\nu(x) \leq \sum_{k=0}^{+\infty} a_k^p \| f \|_G^p = \\
= C \| f \|_G^p,
\]
and
\[
\| u^{-1} X_{A_k} \|_{L^{\infty}(A_k, d\nu)} = (a_k^{-1} C_k)^p \| w_k \|_{L^{\infty}(A_k, d\nu)} \leq (a_k^{-1} C_k)^p.
\]

2. Applications

We introduce first some notation.

Given \( 1 < p < \infty \) and \( 0 < \gamma < n \) we shall define the following classes of weights \( w(x) \) in \( \mathbb{R}^n \).

\[(2.1) \quad Z_{p,\gamma} = \{ w : \int_{\mathbb{R}^n} w(x)(1 + |x|)^{(\gamma-n)p} dx < +\infty \}\]

\[(2.2) \quad D_{p,\gamma} = \{ w : \int_{\mathbb{R}^n} w(x)(1 - |x|)^{-(\gamma-n)p} dx < +\infty \} \]

\[(2.3) \quad D^*_{p,\gamma} = \{ w : \sup_{R \geq 1} \int_{|x| \leq R} w^{1-p'}(x) dx < +\infty \}, \]

when \( \gamma = 0 \), we shall write simply \( Z_p, D_p \) and \( D^*_p \).

Remark.

It is easy to check that if \( p < q \) then \( D_p \subset D^*_p \subset D^*_q, \) \( D_p \not\subset D_q \), and \( D^*_p \not\subset D^*_q \), in fact the weight \( v(x) = (1 + |x|^n)^{-1} \) belongs to \( D^*_p \), \( 1 < r < \infty \) but \( v \not\in D_q \) for any \( q, 1 < q < \infty \). Finally the weight \( \omega_p(x) = |x|^n(p-1)(1 + |x|^n)^{-p}(1 + |\log |x||)^2(p-1) \) belongs to \( D_p \) but \( \omega_p \not\in D^*_p \), if \( p < r \).
Vector-valued inequalities with weights \[ \text{183} \]

Analogously, given \(1 < p < \infty, 0 \leq \gamma < n\) and a measure \(\mu\) on the upper half plane \(\mathbb{R}^{n+1}_+\), we shall consider the following classes of weights \(w(x,t)\) in \(\mathbb{R}^{n+1}_+\),

\[
(2.4) \quad Z_{p,\gamma}(d\mu) = \{ w : \int_{\mathbb{R}^{n+1}_+} w(x,t)(1 + t + |x|)^{(\gamma-n)p} d\mu(x,t) < +\infty \}
\]

\[
(2.5) \quad D_{p,\gamma}(d\mu) = \{ w : \int_{\mathbb{R}^{n+1}_+} w(x,t)^{1-p'(1 + t + |x|)^{(\gamma-n)p'}} d\mu(x,t) < +\infty \}
\]

\[
(2.6) \quad D_{p,\gamma}^*(d\mu) = \{ w : \sup_{R \geq 1} R^{(\gamma-n)p'} \int_{|x|+t \leq R} w(x,t)^{1-p'} d\mu(x,t) < +\infty \},
\]

when \(\gamma = 0\) we shall write \(Z_p(d\mu), D_p(d\mu)\) and \(D_p^*(d\mu)\).

A. Partial sum operators.

Consider a homogeneous function of degree 0 in \(\mathbb{R}^n\), \(\Omega(x) = \Omega(x')\), which we assume to be of class \(C^1\) outside the origin and satisfying the cancellation property

\[
\int_{|x'|=1} \Omega(x') d\sigma(x') = 0.
\]

For each \(\xi \in \mathbb{R}^n\), we define the kernel \(k_\xi(y) = e^{2\pi i \xi \cdot y} \Omega(y')|y|^{-n}\), and the corresponding operator

\[
T_\xi f(x) = \text{p.v.} \int k_\xi(x-y) f(y) dy =
\]

\[
e^{2\pi i \xi \cdot x} \text{p.v.} \int_{\mathbb{R}^n} \Omega((x-y)')|x-y|^{-n} e^{-2\pi i \xi \cdot y} f(y) dy,
\]

then, we define the operator

\[
T^* f(x) = \sup_{\xi} |T_\xi f(x)|
\]

and consider the inequality

\[
(2.7) \quad \int_{\mathbb{R}^n} |T^* f(x)|^p u(x) dx \leq C \int_{\mathbb{R}^n} |f(x)|^p v(x) dx.
\]

We have the following
(2.8) Theorem. Let $1 < p < \infty$.

(i) If $u \in Z_p$ then (2.7) holds for some $v$, such that $v^\alpha \in Z_p$, for $\alpha < 1$.

(ii) If $v \in D_p \cap D_{p_1}$, for some $p_1 < p$, then (2.7) holds for some $u$, such that $u^\alpha \in D_p$, for $\alpha < 1$.

When $n = 1$ and $\Omega(y) = \frac{1}{n} \text{sign}(y)$ then $T_0 = H$ (Hilbert transform) and the partial sum operators of the Fourier Series can be expressed in terms of $\{T_r\}_{r \in \mathbb{R}}$: For each interval $I = [a, b]$

$$S_1 f(x) = \int_I \hat{f}(\xi) e^{2\pi i x \xi} d\xi = \frac{1}{2i} (T_b f(x) - T_a f(x)).$$

In this case $T^*$ is Carleson's maximal operator, see [C], [H],

$$S^* f(x) = \sup_I |S_1 f(x)| \leq C T^* f(x)$$

and we have

(2.9) Theorem. Let $1 < p < \infty$.

(i) $u \in Z_p$ if and only if (2.7) holds for some $v$,

(ii) If $v \in D_p \cap D_{p_1}$, for some $p_1 < p$, then (2.7) holds for some $u$.

Conversely if (2.7) holds for some $u$ then $v \in D_p$.

(iii) both (i) and (ii) are true if we replace $T^*$ by $S^*$.

B. Littlewood-Paley operators.

Let $\phi \in S(\mathbb{R}^n)$ be such that $\text{supp}(\phi) \subset \{\xi \in \mathbb{R}^n : \frac{1}{2} \leq |\xi| \leq 2\}$, $\phi(\xi) = 1$ in a neighbourhood of $|\xi| = 1$, and

$$\sum_{k \in \mathbb{Z}} \phi(2^k \xi) = 1 \text{ for all } \xi \neq 0.$$

We define the following operator

$$G f(x) = \left( \sum_{k \in \mathbb{Z}} |\varphi_k * f(x)|^2 \right)^{1/2},$$

where $\varphi_k(x) = 2^{kn} \varphi(2^k x)$, and we consider the inequality

(2.10) $$\int_{\mathbb{R}^n} |G f(x)|^p u(x) dx \leq C \int_{\mathbb{R}^n} |f(x)|^p v(x) dx$$

then we have
(2.11) Theorem. Let $1 < p < \infty$

(i) If $u \in Z_p$, then (2.10) holds for some $v$, such that $v^\alpha \in Z_p$ for $\alpha < 1$.

(ii) If $v \in D_p$, then (2.10) holds for some $u$, such that $u^\alpha \in D_p$ for $\alpha < 1$.

C. Operators on the upper half plane.

We shall consider the upper half plane $\mathbb{R}^{n+1}_+ = \mathbb{R}^n \times [0, \infty)$.

Given a measure $dv$ on $\mathbb{R}^{n+1}_+$, we shall say, as usual, that $dv$ is a Carleson measure if there exists a constant $C$ such that for any cube $Q$ in $\mathbb{R}^n$, $\nu(Q) \leq C|Q|$ where $Q = \{(x, t) : x \in Q, 0 \leq t \leq \text{side length of } Q\}$ and $|Q|$ stands for the Lebesgue measure of $Q$.

Given a measure $d\mu$ on $\mathbb{R}^{n+1}_+$, we shall consider the following operators:

(2.12) Generalized fractional integrals. Let $0 < \gamma < n$ and

$$K_\gamma(x, t, u) = c_n(|x| + t + u)^{-n}, \quad x \in \mathbb{R}^n, \quad t, u \in [0, \infty).$$

Then we define, for compactly supported $f$ on $\mathbb{R}^{n+1}_+$

$$T_{\mu, \gamma}f(x, t) = \int_{\mathbb{R}^{n+1}_+} K_\gamma(x - y, t, u)f(y, u)d\mu(y, u), \quad x \in \mathbb{R}^n, \quad y \geq 0.$$ 

If $f$ is a compactly supported function on $\mathbb{R}^n$ and $K_\gamma(x, t) = c_n(|x| + t)^{-n}, \quad x \in \mathbb{R}^n, \quad t \in [0, \infty)$, we define

$$T_\gamma f(x, t) = \int_{\mathbb{R}^n} K_\gamma(x - y, t)f(y)dy, \quad (x, t) \in \mathbb{R}^{n+1}_+$$

(2.13) Generalized Poisson integrals and Balayages.

Let $K$ be a function $K : \mathbb{R}^n \times \mathbb{R}^n \times [0, \infty) \times [0, \infty) \to \mathbb{R}^+$ that satisfies

$$K(x, y, t, u) \leq \frac{c_n}{(|x - y| + t + u)^n}, \quad x, y \in \mathbb{R}^n, \quad t, u \in [0, \infty),$$

we define the operator

$$T_{\mu, 0}f(x, t) = p.v. \int_{\mathbb{R}^{n+1}_+} K(x, y, t, u)f(y, u)d\mu(y, u), \quad (x, t) \in \mathbb{R}^{n+1}_+.$$
(2.14) Maximal operators. Let $0 \leq \gamma < n$, we define, for functions $f$ defined on $\mathbb{R}^{n+1}_+$, the following maximal operator $M_{\mu,\gamma} f(x,t) = \sup\{|Q|^{\frac{n}{n-1}} \int_Q |f(y,s)|d\mu(y,s)\}$, $(x,t) \in \mathbb{R}^{n+1}_+$, where the supremum is taken over the cubes $Q$ in $\mathbb{R}^n$ centered at $x$, with sides parallel to the axes and having side length at least $t$.

For functions $f$ defined on $\mathbb{R}^n$ we define

$$M_{\gamma} f(x,t) = \sup\{|Q|^{\frac{n}{n-1}} \int_Q |f(y)|dy\}, \quad (x,t) \in \mathbb{R}^{n+1}$$

where the supremum is taken over the cubes $Q$ in $\mathbb{R}^n$ centered at $x$, with sides parallel to the axes and having side length at least $t$.

We consider the inequality

$$\int_{\mathbb{R}^{n+1}} |T f(x,t)|^{p_u(x,t)}d\nu(x,t) \leq C \int_{\mathbb{R}^{n+1}} |f(x,t)|^{p_v(x,t)}d\mu(x,t)$$

(2.15) Theorem. Let $1 < p < \infty$, $0 \leq \gamma < n$. Let $d\nu, d\mu$ be two measures on $\mathbb{R}^{n+1}_+$ such that $d\nu$ is Carleson and let $\nu$ a weight on $\mathbb{R}^{n+1}_+$, we have

(i) if $\nu \in D_{p,\gamma}(d\mu)$ then (2.15) holds for the operator $T_{\mu,\gamma}$ for some $u$ such that $u^\alpha \in D_{p,\gamma}(d\nu)$ for $\alpha < 1$,

(ii) $\nu \in D_{p,\gamma}^*(d\mu)$ if and only if (2.15) holds for the operator $M_{\mu,\gamma}$ with $u$ such that $u^\alpha \in D_{p,\gamma}(d\nu)$.

(2.17) Theorem. Let $1 < p < \infty$, $0 \leq \gamma < n$. Let $d\mu$ and $d\nu$ be two measures on $\mathbb{R}^{n+1}_+$, $u(x,t)$ be a weight on $\mathbb{R}^{n+1}_+$. Assume that $d\mu$ is a Carleson measure, then we have

(i) If $u \in Z_{p,\gamma}(d\nu)$ then (2.15) holds for $T_{\mu,\gamma}$ with some $v$ such that $v^\alpha \in Z_{p,\gamma}(d\mu)$, $\alpha < 1$.

(ii) $u \in Z_{p,\gamma}^*(d\nu)$ if and only if (2.15) holds for $M_{\mu,\gamma}$ with some $v$ such that $v^\alpha \in Z_{p,\gamma}(d\mu)$, $\alpha < 1$.

We would like to emphasize some particular cases of the above results.

(2.18) Given a function $g : \mathbb{R}^n \to \mathbb{R}$ we consider its Poisson integral

$$P g(x,t) = c_n \int_{\mathbb{R}^n} \frac{t}{(|x-y|^2 + t^2)^{n+2/2}} g(y)dy, \quad (x,t) \in \mathbb{R}^{n+1}_+,$$
on the other hand given a measure \( d\mu \) on \( \mathbb{R}^{n+1}_+ \) the balayage of \( d\mu \) is defined by

\[
P^*(d\mu)(x) = \int_{\mathbb{R}^{n+1}_+} \frac{c_n t}{(|x - y|^2 + t^2)^{\frac{n+1}{2}}} d\mu(y,t), x \in \mathbb{R}^n,
\]

see [A, B].

We have the following results

(2.19) Corollary. Let \( 1 < p < \infty \)

(i) If \( v \) is a weight in \( \mathbb{R}^n \) such that \( v \in D_p \), then for any Carleson measure \( dv \) there exists a weight \( u \) in \( \mathbb{R}^{n+1}_+ \) such that

\[
(2.20) \quad \int_{\mathbb{R}^{n+1}_+} |P^*(d\mu)|^p u(x,t)dv(x,t) \leq C \int_{\mathbb{R}^n} |g(x)|^p v(x)dx,
\]

and \( u^\alpha \in D_p(d\nu) \) for \( \alpha < 1 \).

(ii) If \( u \) is a weight in \( \mathbb{R}^n \) such that \( u \in Z_p \) then for any Carleson measure \( d\mu \) there exist a weight \( v \) such that

\[
(2.21) \quad \int_{\mathbb{R}^n} P^*(d\mu)^p(x)u(x)dx \leq C \int_{\mathbb{R}^{n+1}_+} |f(x,t)|^p v(x,t)d\mu(x,t),
\]

and \( v^\alpha \in Z_p(d\mu) \), for \( \alpha < 1 \).

(iii) Given a measure \( dv \) in \( \mathbb{R}^{n+1}_+ \) and a weight \( u \in Z_p(dv) \) then there exists a weight \( v \) such that (2.20) holds and \( v^\alpha \in Z_p \), for \( \alpha < 1 \).

(iv) Given a measure \( d\mu \) in \( \mathbb{R}^{n+1}_+ \) and a weight \( v \in D_p(d\mu) \) then there exists a weight \( u \) such that (2.21) holds and \( u^\alpha \in D_p \), for \( \alpha < 1 \).

Proof of Corollary (2.19):

Proof of parts (i) and (iii). Take the measure \( d\mu(x,t) = dx \otimes \delta_0(t) \), where \( \delta_0(t) \) is the Dirac's delta at \( t = 0 \). Given a function \( g(x) \) we consider the function \( f(x,u) = g(x) \) then

\[
T_{\mu,0} f(x,t) = P g(x,t),
\]

with

\[
K_{\mu,0}(x,y,t,s) = \frac{c_n t}{(|x - y|^2 + t^2)^{\frac{n+1}{2}}},
\]

now (i) follows from Theorem (2.16.1) and (iii) follows from Theorem (2.17.1).
For the proof of (ii) and (iv), we consider the measure $d\nu(x,t) = dx \otimes \delta_0(t)$ and then (ii) follows from Theorem (2.17.i) and (iv) follows from Theorem (2.16.i), since $P^* (f d\mu)(x) = T_{\mu,0} f(x,t)$ with $K_{\mu,0}(x,y,t,u) = c_n \frac{1}{(|x-y|^2 + u^2)^{n+\frac{1}{2}}}$. 

(2.22) Remark. This last Corollary should be compared with the characterization, see [S], of the pairs $(v, d\nu)$ of weight and measure such that the Poisson integral maps $L^p(\mathbb{R}^n, v)$ into $L^p(\mathbb{R}^{n+1}_+, d\nu)$.

(2.23) Remark. It is clear that if we take $d\mu(x,t) = dx \otimes \delta_0(t)$ we get the operator

\[ M_\gamma f(x) = \sup \{|Q|^{\frac{2}{n}-1} \int_Q |f(y)| dy\}, \]

in particular

\[ M_\gamma f(x,0) = M_\gamma f(x) = \sup_{x \in Q} \frac{1}{|Q|^{1-\gamma/n}} \int_Q |f(y)| dy. \]

On the other hand

\[ M_{\mu,\gamma} f(x,0) = \sup_{x \in Q} \{|Q|^{\frac{2}{n}-1} \int_Q |f(y,u)| d\mu(y,u)\}, \]

in particular

\[ M_{\mu,0} f(x,0) = C f(x) = \sup_{x \in Q} \frac{1}{|Q|} \int_Q |f(y,u)| d\mu(y,u). \]

Therefore if we call $T$ to any operator $M_\gamma, M_\gamma$ or $C$, then Theorems (2.16) and (2.17) give necessary and sufficient conditions on the weight $\nu$ (resp. $\mu$) such that

\[ \int |Tf|^p \nu \leq \int |f|^p \nu \]

is satisfied for some $\nu$ (resp. $\nu$).

The case $M_\gamma$ were studied for Rubio de Francia, see [R de F, 1].

The class of the Banach spaces $E$ such that the Hilbert transform

$$H f(x) = p.v. \int_{\mathbb{R}} \frac{f(y)}{x-y} dy$$

is bounded from $L_E^2(\mathbb{R})$ into $L_E^2(\mathbb{R})$ were characterized by Burkholder and Bourgain, see [Bk], [B], and it is denoted by U.M.D.

If $E$ is a Banach lattice of functions with absolute value $| \cdot |$, then the following extension of the Hardy-Littlewood maximal operator can be defined

$$\tilde{M} f(x) = \sup_{x \in Q} \frac{1}{|Q|} \int_Q |f(y)| dy.$$  

It is known, see [R de F, 2], that a Banach lattice of functions $E$ is U.M.D. if and only if $\tilde{M}$ maps $L_E^p(\mathbb{R}^n)$ into $L_E^p(\mathbb{R}^n)$ and $L_{E*}^p(\mathbb{R}^n)$ into $L_{E*}^p(\mathbb{R}^n)$ for some $p$, $1 < p < \infty$, and $E^*$ is the dual space of $E$.

(2.24) Theorem. Let $1 < p < \infty$

(i) A weight $v$ in $\mathbb{R}$ belongs to $D_p$ if and only if there exists $u, u^\alpha \in D_p$ for $\alpha < 1$ and such that for any U.M.D. Banach space $E$, we have,

$$\int_{\mathbb{R}} \|H f(x)\|^p_E u(x) dx \leq C \int_{\mathbb{R}} \|f(x)\|^p_E v(x) dx.$$  

(ii) A weight $u$ in $\mathbb{R}$ belongs to $Z_p$ if and only if there exists $v, v^\alpha \in Z_p$, for $\alpha < 1$ and such that (2.25) holds for every U.M.D. Banach space $E$.

(2.26) Theorem. Let $1 < p < \infty$

(i) If a weight $v$ in $\mathbb{R}^n$ belongs to $D_p$ then there exists $u, u^\alpha \in D_p$ for $\alpha < 1$, such that

$$\int_{\mathbb{R}^n} \|\tilde{M} f(x)\|^p_E u(x) dx \leq C \int_{\mathbb{R}^n} \|f(x)\|^p_E v(x) dx,$$

holds for any U.M.D. Banach lattice of functions $E$. In order to satisfy (2.27) it is necessary that $v \in D_p^\ast$.

(ii) A weight $u$ in $\mathbb{R}^n$ belongs to $Z_p$, if and only if there exists $v, v^\alpha \in Z_p$ for $\alpha < 1$, such that (2.27) holds for any U.M.D. Banach lattice of functions $E$. 
3. Proofs

The main ingredient will be to show that the corresponding operator satisfies inequality (1.2).

A. Partial sums operators.

We consider the $\ell^\infty$-valued operator

$$Tf(x) = \{p.v. \int_{\mathbb{R}^n} \frac{\Omega((x-y)')}{|x-y|^n} e^{2\pi i \xi \cdot x} f(y) dy\}_{\xi \in \mathbb{R}^n},$$

observe that $T^* f(x) = \|Tf(x)\|_{\ell^\infty}$. Therefore in order to prove Theorem (2.8) it is enough to find conditions on $u$ and $v$ in order to satisfy

$$\int_{\mathbb{R}^n} \|Tf(x)\|_{\ell^\infty}^2 u(x) dx \leq C \int_{\mathbb{R}^n} |f(x)|^2 v(x) dx.$$  \hspace{1cm} (3.1)

It is known by Carleson's Theorem, see [C], that $T$ maps $L^s(\mathbb{R}^n)$ into $L^s_{\ell^\infty}(\mathbb{R}^n), 1 < s < \infty$. On the other hand $T$ is given by the $\ell^\infty$-kernel

$$K(x, y) = \{\frac{\Omega((x-y)')}{|x-y|^n} e^{-2\pi i \xi \cdot y}\}_{\xi},$$

with these observations it can be proved, see [R de F, R, T], that the operator defined by

$$(f_j)_j \rightarrow (Tf_j)_j$$

maps $L^{s_p}(\mathbb{R}^n)$ into $L^{s_p}(\ell^\infty)(\mathbb{R}^n), 1 < p, s < \infty$.

We can consider also the transpose operator $\tilde{T}$, acting on $\ell^1$-valued functions $f(x) = (f_\xi(x))_\xi$, defined by

$$\tilde{T}f(x) = \int K(x, y) f(y) dy,$$

The operator $\tilde{T}$ is given by the $\ell^\infty = \mathcal{L}(\ell^1, \mathbb{C})$-valued kernel

$$\tilde{K}(x, y) = \{\frac{\Omega((x-y)')}{|x-y|^n} e^{2\pi i \xi \cdot x}\}_{\xi \in \mathbb{R}},$$

and again the operator defined by

$$(f_j)_j \rightarrow (\tilde{T}f_j)_j$$
is bounded from $L^s_{\mathcal{P}}(\mathbb{R}^n)$ into $L^s_{\mathcal{P}}(\mathbb{R}^n)$, $1 < p, s < \infty$, and from $L^1_{\mathcal{P}}(\mathbb{R}^n)$ into weak-$L^1_{\mathcal{P}}(\mathbb{R}^n)$, $1 < p < \infty$, see [R de F, R, T].

On the other hand it is clear that $u \in Z_p$ if and only if $u^{1-p'} \in D_{p'}$, hence a simply duality argument says that (i) in Theorem (2.8) is equivalent to the following statement:

(i) If $u \in D_p$, $1 < p < \infty$, then

\[(3.2) \quad \int_{\mathbb{R}^n} |\hat{T}f(x)|^p u(x) dx \leq C \int_{\mathbb{R}^n} \|f(x)\|_{L^p(\mathbb{R}^n)}^p v(x) dx\]

for some $u$, such that $u^\alpha \in D_p$, for $\alpha < 1$.

Now in order to apply Theorem (1.1) to the operators $\hat{T}$ and $\hat{T}$ we shall need the following

(3.3) Proposition. Let $0 < s < 1 < p$

(i) Assume that $v \in D_p$, then we have

\[
\left\| \left( \sum_j |\hat{T}_j f_j|^p \right)^{1/p} \right\|_{L^s(S_k)} \leq C_s, p 2^{kn/s} \left( \sum_j \|f_j\|_{L^p(\mathbb{R}^n)}^{p} \right)^{1/p}
\]

(ii) Assume that $v \in D_p \cap D^*_p$, for some $p_1 < p$, then we have

\[
\left\| \left( \sum_j \|\hat{T}_j f_j\|_{L^{p_1}(\mathbb{R}^n)}^{p_1} \right)^{1/p_1} \right\|_{L^s(S_k)} \leq C_s, p 2^{kn/s} \left( \sum_j \|f_j\|_{L^{p_1}(\mathbb{R}^n)}^{p_1} \right)^{1/p_1}
\]

$k = 0, 1, 2, \ldots$, where $S_0$ is the unit ball and each $S_k$, $k \geq 1$, is the spherical shell:

\[S_k = \{x : 2^{k-1} \leq |x| \leq 2^k\}\]

Proof. Given $k \geq 0$, we decompose each function $f$ as $f = f' + f''$, where $f' = f \chi_{B_k}$, $f'' = f - f'$ and $B_k = \{x : |x| < 2^{k+1}\}$.

It is clear that $\|\hat{K}(x, y)\|_{L^{\infty}} \leq C|x|^{-n}$ when $|x| > 2|y|$, and therefore for all $x \in S_k$.

\[
|\hat{T}f''(x)| \leq \int_{|b| > 2^{k+1}} |\hat{K}(x, y)f(y)|dy \leq \int_{|b| > 2^{k+1}} \|f(y)\|_{L^1} |y|^{-n} dy
\]

\[
\leq C \left( \int_{\mathbb{R}^n} \|f(y)\|_{L^1} v(y) dy \right)^{1/p} \left( \int_{\mathbb{R}^n} \frac{v(y)^{1-p'}}{(1 + |y|)^{np'}} dy \right)^{1/p'}
\]

\[
\leq C \|f\|_{L^p(\mathbb{R}^n)}.
\]
where in the last inequality we have used that \( v \in D_p \), in particular we have
\[
\sup_{x \in S_k} \left( \sum_j |\tilde{T}f_j''(x)|^p \right)^{1/p} \leq C \left( \sum_j \|f_j\|_{L^p_v}^p \right)^{1/p},
\]
hence
\[
\| \left( \sum_j |\tilde{T}f_j''|^p \right)^{1/p} \|_{L^s(S_k)} \leq C 2^{kn/s} \left( \sum_j \|f_j\|_{L^p_v}^p \right)^{1/p}.
\]

On the other hand, as we said before, \( \tilde{T} \) maps \( L^1_{p'(\ell_1)} \) into weak-\( L^1 \), therefore we use Cotlar's inequality (see [GC, R de F, V. 2.8]) and we get
\[
\| \left( \sum_j |\tilde{T}f_j'|^p \right)^{1/p} \|_{L^s(S_k)} \leq |S_k|^{1/s - 1} \| \sum_j |\tilde{T}f_j'|^p \|_{\text{weak-}L^1(S_k)}
\]
\[
\leq C_p |S_k|^{1/s - 1} \left( \sum_j \|f_j'\|_{\ell_1}^p \right)^{1/p} \|_{L^1}
\]
\[
\leq C_p |S_k|^{1/s - 1} \left( \int_{\mathbb{R}^n} \left( \sum_j \|f_j(x)\|_{\ell_1}^p \right) u(x) \, dx \right)^{1/p} \left( \int_{|x| < 2^{k+1}} u(x)^{1-p'} \, dx \right)^{1/p'}
\]
\[
\leq C_p 2^{kn/s} \left( \sum_j \|f_j\|_{L^p_v}^p \right)^{1/p},
\]
where in the last inequality we have used that \( v \in D_p \). This finishes the proof of (i).

In order to prove (ii) we decompose again each function as before \( f = f' + f'' \).

Since \( \|K(x,y)\|_{L^{\infty}} \leq C |x|^{-n} \) and \( v \in D_p \), we have analogously as for \( \tilde{T} \), that
\[
\| \left( \sum_j \|Tf_j''\|_{\ell_\infty}^p \right)^{1/p} \|_{L^s(S_k)} \leq C 2^{kn/s} \left( \sum_j \|f_j\|_{L^p_v}^p \right)^{1/p}.
\]
On the other hand $T$ maps $L^r_{\mathcal{F}_P}(\mathbb{R}^n)$ into $L^p_{\mathcal{F}_P}(\mathbb{R}^n)$, $1 < r, p < \infty$, therefore by Hölder's inequality we have

$$\left\| \sum_j \|Tf_j\|_p^p \right\|_{L^q(S_k)} \leq S_k^{1/2 - 1/p} \left( \sum_j \|Tf_j\|_\infty^p \right)^{1/p} \|L^r(S_k)\|
$$

$$\leq C S_k^{1/2 - 1/p} \left( \sum_j |f_j|^p \right)^{1/p} \|L^r\|
$$

$$\leq C S_k^{1/2} \left( \int_{\mathbb{R}^n} \left( \sum_j |f_j|^p \right) v(x) \, dx \right)^{1/p} \left( \frac{1}{\int_{|x|<2^{k+1}} v(x)^{-\frac{n}{p'}(\frac{p}{r})'}} \right)^{\frac{1}{p'}}
$$

Now we choose $r$ such that $\frac{p}{r} = p_1$ and by using the hypothesis $v \in D^1_{\mathcal{F}_P}$, we have

$$\left\| \sum_j \|Tf_j\|_\infty^p \right\|_{L^q(S_k)} \leq \left( \sum_j \|f_j\|_{L^p(v)}^p \right)^{1/p} 
$$

this finishes the proof of (ii).

Proof of Theorem (2.8):

As we said above in order to prove (i) it is enough to prove (3.2). We observe that by the last Proposition the operator $T$ satisfies (1.2) with $F = \mathbb{R}$, $A_k = S_k$, $C_k = C2^{k-1/s}$ and $G = L^p_{\mathcal{F}_P}(v)$, then by Theorem (1.1) there exists a weight $u$ satisfying (3.2).

Moreover $u$ can be found such that

$$\left( \int_{S_k} u(x)^{1-\sigma} \, dx \right)^{1/\sigma - 1} \leq (a_k^{-1}2^{kn/s})p$$

with $\sigma = (\frac{p}{r})'$ and $a_k$ such that $\sum a_k^p < \infty$.

Therefore if we take $q, 1 < q < \infty$, such that $q - 1 < p' - 1$, we have

$$\int_{\mathbb{R}^n} \frac{u(x)}{(1+|x|)^{np'}} \, dx \leq \int_{S_k} u(x)^q \, dx \leq \sum_{K=0}^\infty 2^{-Knq'} \int_{S_k} u(x)^q \, dx \leq \sum_{K=0}^\infty 2^{-Knq'} (a_k^{-1}2^{kn/s})^p \left( \frac{q-1}{q-1} \right)^p \left( \frac{2^{kn}}{q-1} \right)^p,$$
but \(-p' + \frac{2}{q}(q - 1) + \frac{1}{(q - 1)}\) = \((1 - p') + (q - 1) < 0\), then if we chose 
\(\alpha_K = 2^{Kn_c}\), with \(\varepsilon\) small enough, we get that 
\(u^\alpha \in D_p\) with 
\(\alpha = \frac{q-1}{p'-1}\).

Analogously in order to prove (ii) we observe that by using Proposition (3.3) (ii) \(T\) satisfies (1.2) with \(F = \ell^\infty\), \(A_k = S_k\), \(C_k = C2^{kn/s}\) and 
\(G = L^p(v)\), then Theorem (1.1) can be applied as before. 

Proof of Theorem (2.9):
The sufficient conditions on (i) and (ii) have been proved in Theorem (2.8). In order to obtain the necessary conditions we observe that 

\[ T^*f(x) \geq |Hf(x)|, \]

where \(H\) is the Hilbert transform, then the conditions in order to have (2.7) are also necessary in order to have

\[ \int_{\mathbb{R}} |Hf(x)|^pu(x)dx \leq C \int_{\mathbb{R}} |f(x)|^pv(x)dx, \]

but it is well known that in order to have (3.4) for some \(u\) (resp. some \(v\)) it is necessary that \(v \in D_p\) (resp. \(u \in Z_p\)), see [GC, R de F].

Finally to prove (iii) we observe that as \(S^*f(x) \leq CT^*f(x)\) we have 
that the sufficient conditions for weights in order to have (2.7) are also 
sufficient for

\[ \int_{\mathbb{R}} |S^*f(x)|^pu(x)dx \leq C \int_{\mathbb{R}} |f(x)|^pv(x)dx. \]

On the other hand observe that an inequality of the type (3.5) implies 
that for any interval \(I \subset \mathbb{R}\), the inequality

\[ \int_{\mathbb{R}} |Sf(x)|^pu(x)dx \leq C \int_{\mathbb{R}} |f(x)|^pv(x)dx \]

holds with \(C\) independent of \(I\) and hence (3.4) holds and the necessity 
conditions again are the same that they are for the Hilbert transform.

B. Littlewood-Paley operators.

Our idea is to prove Theorem (2.11) following the lines of the proof of 
Theorem (2.8).

We consider the \(\ell^2\)-valued operator

\[ Tf(x) = \{\varphi_k \ast f(x)\}_{k \in \mathbb{Z}}. \]
where $\varphi_k$ are the functions defined in section 2 part B. It is clear that $Gf(x) = \|Tf(x)\|_{\ell^2}$ and then we are going to deal with the following inequality

\begin{equation}
\int_{\mathbb{R}^n} \|Tf(x)\|_{\ell^2}^2 u(x) \, dx \leq C \int_{\mathbb{R}^n} |f(x)|^p v(x) \, dx,
\end{equation}

in instead of (2.10).

It is known that $T$ is given by the $\ell^2$-valued kernel $K(x, y) = \{\varphi_k(x - y)\}_{k \in \mathbb{Z}}$ that satisfies

$$\|K(x, y)\|_{\ell^2} \leq C|x - y|^{-n}.$$ 

Moreover the operator defined by $(f^j)_j \rightarrow (Tf^j)_j$ is bounded from $L^1_{\ell^p}(\mathbb{R}^n)$ into weak-$L^1_{\ell^p}(\mathbb{R}^n)$, $1 < p < \infty$, see [R de F, R, T].

We can consider also the adjoint operator $\tilde{T}$, acting on $\ell^2$-valued functions, $f(x) = (f^k(x))_k$, and defined by

$$\tilde{T}f(x) = \tilde{T}((f^k)_k)(x) = \sum_k \varphi_k \ast f(x),$$

$\tilde{T}$ is defined by the $\ell^2 = L(\ell^2, \mathbb{C})$-valued kernel

$$\tilde{K}(x, y) = \{\varphi_k(y - x)\}_k$$

and again the operator $\tilde{T}((f^j)_j)$ is bounded from $L^1_{\ell^p}(\ell^2)$ into weak-$L^1_{\ell^p}$, $1 < p < \infty$.

Therefore (i) and (ii) of Theorem (2.11) are equivalent statements and it is enough to prove (ii).

In order to prove (ii) we need the following

(3.7) Proposition. Let $v \in D_p$, $1 < p < \infty$ and let $s < 1 < p$. Then we have

$$\left\|\left(\sum_j \|Tf^j\|_{\ell^2}^p\right)^{1/p}\right\|_{L^s(S_K)} \leq C_{s, p} 2^{K_n/s} \left(\sum_j \|f^j\|_{L^p(v)}^p\right)^{1/p}$$

$K = 0, 1, 2, \ldots$, where $S_K$ are the sets defined in (3.3).

The proof of this Proposition follows the pattern of the proof of Proposition (3.3).

Once we know Proposition (3.7) the proof of Theorem (2.11) can be built as the one of Theorem (2.8).
C. Operators on the upper half plane.

Our goal is to establish inequality (1.2) in this context.

We shall denote by $\Gamma(x)$ the cone of aperture one whose vertex is $x$, $x \in \mathbb{R}^n$, i.e.

$$\Gamma(x) = \{(y, t) \in \mathbb{R}^{n+1}_+ : |x - y| < t\}.$$  

(3.8) Definition. Given a positive measure $d\mu$ on $\mathbb{R}^{n+1}_+$, we define

$$A_\mu f(x) = \int_{\Gamma(x)} f(y, t) \frac{d\mu(y, t)}{tn}, \ x \in \mathbb{R}^n.$$  

(3.9) Proposition. Let $1 < p < \infty$ and $d\mu$ be a measure on $\mathbb{R}^{n+1}_+$. Then $A_\mu$ is a bounded linear operator from $L^p(\mathbb{R}^{n+1}_+, d\mu)$ into $L^p(\mathbb{R}^n, dx)$.

Proof: $A_\mu$ is a positive linear operator, then it is enough to prove that $A_\mu$ maps $L^1(\mathbb{R}^{n+1}_+, d\mu)$ into $L^1(\mathbb{R}^n, dx)$, but

$$\|A_\mu f\|_{L^1(dx)} = \int_{\mathbb{R}^n} \left| \int_{\Gamma(x)} f(y, t) \frac{d\mu(y, t)}{tn} \right| dx$$

$$\leq \int_{\mathbb{R}^{n+1}_+} \left( \int_{\mathbb{R}^n} x_{\Gamma(x)}(y, t)|f(y, t)| dx \right) \frac{d\mu(y, t)}{tn}$$

$$\leq \int_{\mathbb{R}^{n+1}_+} \left( \frac{1}{tn} \int_{B(y, t)} dx \right) |f(y, t)| d\mu(y, t)$$

$$\leq C_n \|f\|_{L^1(\mathbb{R}^{n+1}_+, d\mu)}.$$  

(3.10) Remark. Given a positive measure $d\mu$ on $\mathbb{R}^{n+1}_+$, we can define the operator

$$A_1 f(x) = \int_{\Gamma(x)} |f(y, t)| \frac{d\mu(y, t)}{tn}, \ x \in \mathbb{R}^n.$$  

The operator $A_1$ is related with "tent spaces", see [C, M, S] and [R, T2]. It can be showed that $A_1$ maps $L^s(\mathbb{R}^{n+1}_+, d\mu)$ into $L^s(\mathbb{R}^n, dx)$, $1 < s < \infty$, if only if $d\mu$ is a Carleson measure, see [R, T2]. Therefore, since $A_\mu(|f|)(x) = A_1(f)(x)$, we have that $A_\mu$ maps $L^s(\mathbb{R}^{n+1}_+, d\mu)$ into $L^s(\mathbb{R}^n, dx)$, $1 < s < \infty, 1 \leq p \leq \infty$ if and only if $d\mu$ is a Carleson measure.
(3.11) **Proposition.** Let $d\mu$ be a measure on $\mathbb{R}^{n+1}_+$. The following inequalities hold:

\[(3.12)\quad M_{\gamma,f}(x,t) \leq C_n M_{\gamma}(A_{\mu}|f|)(x,t), \quad (x,t) \in \mathbb{R}^{n+1}_+
\]

where $M_y,T_y$ and $P$ are the operators defined on (2.14), (2.12) and (2.18). By $C_n$ we denote a constant no necessarily the same at each occurrence.

**Proof.** Let $B = B(x_0, r), x_0 \in \mathbb{R}^n, r > 0$, be a ball in $\mathbb{R}^n$. If $(x,t) \in \tilde{B}$ then $|x - x_0| + t < r$, in particular we have

\[
|B|^{\frac{\gamma}{n}} \int_{B} |f(y,u)|d\mu(y,u) = c_n |B|^{\frac{\gamma}{n}} \int_{B} \left( \frac{1}{u^n} \int_{B(y,u)} dz \right) d\mu(y,u)
\]

\[
= c_n |B|^{\frac{\gamma}{n}} \int_{\mathbb{R}^{n+1}} \int_{\mathbb{R}} X_B(y,u) X_{B(y,u)}(z) |f(y,u)| \frac{dz d\mu(y,u)}{u^n}
\]

\[
\leq c_n |B|^{\frac{\gamma}{n}} \int_{\mathbb{R}} A_{\mu}(|f|)(z) dz \leq c_n M_{\gamma}(A_{\mu}f)(x,t).
\]

In order to prove (3.13), we observe that

\[
[T_{\mu,\gamma}f(x,t)] = c_n \int_{\mathbb{R}_{+}^{n+1}} \frac{|f(y,u)|}{(|x - y| + t + u)^{n-\gamma}} \left( \frac{1}{u^n} \int_{B(y,u)} dz \right) d\mu(y,u)
\]

\[
\leq c_n \int_{\mathbb{R}_{+}^{n+1}} \int_{\mathbb{R}} \frac{|f(y,u)|}{(|x - y| + t + u)^{n-\gamma}} X_{B(y,u)}(z) \frac{dz d\mu(y,u)}{u^n},
\]

but if $z \in B(y,u)$, then $|x - z| + t \leq |x - y| + u + t$ and we have

\[
[T_{\mu,\gamma}f(x,t)] \leq c_n \int_{\mathbb{R}_{+}^{n+1}} \int_{\mathbb{R}} \frac{|f(y,u)|}{(|x - z| + t)^{n-\gamma}} X_{B(y,u)}(z) \frac{dz d\mu(y,u)}{u^n}
\]

\[
= c_n \int_{\mathbb{R}^n} A_{\mu}(|f|)(z) \frac{dz}{(|x - z| + t)^{n-\gamma}} = c_n T_{\gamma}(A_{\mu}|f|)(x,t).
\]

The proof of (3.14) is analogous. 

The following Theorem can be found in [R, T1].
(3.15) Theorem. Let \( 1 < p < \infty \), and \( dv \) be a Carleson measure on \( \mathbb{R}^{n+1}_+ \), then the operators \( M_\gamma \), with \( 0 \leq \gamma < n \), \( T_\gamma \), with \( 0 < \gamma < n \) and \( P \) are bounded from \( L^1_{\xi_p}(\mathbb{R}^n, dx) \) into weak \( L^\infty_{\xi_p^{-\gamma}}(\mathbb{R}^{n+1}_+, dv) \) and from \( L^p_{\xi_p}(\mathbb{R}^n, dx) \) into \( L^p_{\xi_p}(\mathbb{R}^{n+1}_+, dv) \), \( \frac{n}{n-\gamma} < s < \infty \), \( \frac{1}{q} = \frac{\alpha}{n} + \frac{1}{r} \).

Taking into account this theorem and Proposition (3.11) we shall be able to prove the following.

(3.16) Theorem. Let \( 1 < p < \infty \), \( 0 \leq \gamma < n \) and \( dv \) be a Carleson measure in \( \mathbb{R}^{n+1}_+ \).

Given a measure \( d\mu \) in \( \mathbb{R}^{n+1}_+ \) then the operators \( M_{\mu,\gamma} \) and \( T_{\mu,\gamma} \) are bounded from \( L^1_{\xi_p}(\mathbb{R}^{n+1}_+, d\mu) \) into weak \( L^\infty_{\xi_p^{-\gamma}}(\mathbb{R}^{n+1}_+, dv) \).

Moreover if \( d\mu \) is a Carleson measure, then the operators \( M_{\mu,\gamma} \) and \( T_{\mu,\gamma} \) are bounded from \( L^p_{\xi_p}(\mathbb{R}^{n+1}_+, d\mu) \) into \( L^p_{\xi_p}(\mathbb{R}^{n+1}_+, dv) \), \( \frac{1}{q} = \frac{\alpha}{n} + \frac{1}{r} \).

Proof: The first part of the theorem is a direct consequence of (3.9), (3.11) and (3.15). The second part is a consequence of (3.10), (3.11) and (3.15). ■

(3.17) Remark. The proof of Theorem (3.15) is based in the theory of vector-valued Calderón-Zygmund Kernels. That proof is not available for the case of Theorem (3.16).

Now we can prove inequality (1.2) for these operators.

(3.18) Proposition. Let \( 0 < s < 1 < p < \infty \), \( 0 \leq \gamma < n \) and let \( dv \) a Carleson measure in \( \mathbb{R}^{n+1}_+ \).

Let \( S_K, K = 0, 1, 2, ... \), be the sets in \( \mathbb{R}^{n+1}_+ \) defined by

\[
S_0 = \{(x, t) \in \mathbb{R}^{n+1}_+, \, |x| + t < 1\}
\]

\[
S_K = \{(x, t) \in \mathbb{R}^{n+1}_+, \, 2^{K-1} \leq |x| + t < 2^K\}, \, \, K = 1, 2, ...
\]

(i) If \( v \in D_{p,\gamma}(d\mu) \) and \( G = L^p(\mathbb{R}^{n+1}_+, vd\mu) \) then

\[
\left\| \left( \sum_j |T_{\mu,\gamma} f_j|^p \right)^{1/p} \right\|_{L^s(S_K, dv)} \leq C 2^{\frac{nK}{s}} \left( \sum_j \|f_j\|_{L^p_G}^p \right)^{1/p}.
\]

(ii) If \( v \in D^*_{p,\gamma}(d\mu) \) and \( G = L^p(\mathbb{R}^{n+1}_+, vd\mu) \) then

\[
\left\| \left( \sum_j |M_{\mu,\gamma} f_j|^p \right)^{1/p} \right\|_{L^s(S_K, dv)} \leq C 2^{\frac{nK}{s}} \left( \sum_j \|f_j\|_{L^p_G}^p \right)^{1/p}.
\]
Proof. Given $K \geq 0$, we decompose each function $f = f' + f''$ where $f' = f \chi_{B_K}$, $f'' = f - f'$ and

$$B_K = \{(x,t) : |x| + t < 2^{K+1}\}.$$  

If $|y| + u > 2(|x| + t)$ then

$$|y| + u \leq |y| + u + 4t \leq |y| + u + 2t + |y| + u - 2|x| \leq 2(|x - y| + t + u).$$

Therefore if $(x, t) \in S_K$ we have

$$|T_{\mu, \gamma}f''(x,t)| = \left| \int_{|y| + u \geq 2^{K+1} + 2(|x| + t)} K_{\gamma}(x-y, t, u) f(y, u) d\mu(y, u) \right|$$

$$\leq c_n \int_{|y| + u \geq 2^{K+1}} |f(y, u)| \frac{d\mu(y, u)}{(|y| + u)^{n-\gamma}}$$

$$\leq c_n \left( \int_{\mathbb{R}_+^{n+1}} |f(y, u)|^p v(y, u) d\mu(y, u) \right)^{1/p}$$

$$\left( \int_{|y| + u \geq 2^{K+1}} \frac{v(y, u)^{1-p'}}{(|y| + u)^{(n-\gamma)p'}} d\mu(y, u) \right)^{1/p'} \leq c_n \|f\|_G.$$

Thus

$$\sup_{(x,t) \in S_K} \left( \sum_j |T_{\mu, \gamma}f_j(x,t)|^p \right)^{1/p} \leq C \left( \sum_j \|f_j\|_G^p \right)^{1/p}$$

and then,

$$\left\| \left( \sum_j |T_{\mu, \gamma}f_j|^p \right)^{1/p} \right\|_{L^s(S_K, dv)} \leq C \nu(S_K)^{1/s} \left( \sum_j \|f_j\|_G^p \right)^{1/p} \leq C \nu(S_K)^{1/s} \left( \sum_j \|f_j\|_G^p \right)^{1/p} \leq C \nu(S_K)^{1/s} \left( \sum_j \|f_j\|_G^p \right)^{1/p}.$$  

On the other hand, as $s < \frac{n}{n-\gamma}$, we use Cotlar's inequality (see [GC, R
de F, V.2.8]) and Theorem (3.16) to get
\[
\|\left(\sum_{j} |T_{\mu,\gamma} f_j|^p\right)^{1/p}\|_{L^s(S_K,d\nu)}
\]
\[
\leq C \nu(S_K)^{1/s-n^{-\gamma}} \left(\sum_{j} |T_{\mu,\gamma} f_j|^p\right)^{1/p}
\]
\[
\leq C 2K^n \left(\sum_{j} |f_j(y)|^p\right)^{1/p}
\]
\[
\leq C 2K^n \left(\int_{QK} \left(\sum_{j} |f_j(y,u)|^p\right)^{1/p}\mu(y,u)\right)^{1/p}
\]
\[
\leq C 2K^n \left(\int |f_j(y,u)|^p v(y,u) d\mu(y,u)\right)^{1/p}
\]
This completes the proof of (i).

In order to prove (ii), we observe that if \((x,t) \in S_K\), then \((x,t) \in \hat{Q}_K\)
where \(Q_K\) is the cube
\[
Q_K = \{y \in R^n : y = (y_1, ..., y_n), |y_i| \leq 2^K, \quad i = 1, ..., n\},
\]
therefore
\[
\frac{1}{|Q_K|^{\gamma-n}} \int_{QK} |f''(y,u)| d\mu(y,u) \leq \int_{B_K} |f''(y,u)| d\mu(y,u) \leq
\]
\[
\leq C_n \|f\|_{C^2} 2K^{(\gamma-n)} \left(\int_{B_K} v(y,u)^{1-p'} d\mu(y,u)\right)^{1/p'} \leq
\]
\[
\leq C_n \|f\|_{C} \sup_{R \geq 1} \left(R^{(\gamma-n)p'} \int_{|x|+u \leq R} v(y,u)^{1-p'} d\mu(y,u)\right)^{1/p'} \leq
\]
\[
\leq C_n \|f\|_{C}.
\]
Now the rest of the proof follows as in (i). □

**Proof of Theorem (2.16):** If \(v \in D_{p,\gamma}(d\mu)\), then, by the last Proposition, inequality (1.2) is satisfied for \(T_{\mu,\gamma}\) with \(A_K = S_K\), \(G = L^p(vd\mu)\), \(F = R\), \(c_K = 2K^n\). Therefore by Theorem (1.1) there exists \(u\) satisfying (2.15) for \(T_{\mu,\gamma}\). Moreover \(u\) is such that
\[
\|u^{-1} \chi_{S_K}\|_{L^{\infty}(A_K,d\nu)} \leq (a_K^{-1} \chi_{2K^n})^p
\]
VECTOR-VALUED INEQUALITIES WITH WEIGHTS

with \( \sigma = \left( \frac{p}{2} \right)' \) and \( \sum \sigma_K^p < +\infty \), then

\[
\int_{\mathbb{R}^{n+1}} \frac{u(x)^{1-\sigma}}{(1 + t + |x|)^{(n-\gamma)p'}} \, dv(x,t) \leq \sum_{K=0}^{\infty} 2^{-K(n-\gamma)p'} (u_{K-1}^{1/2} K_{2n})^p \sigma(1),
\]

but as \( \left( \frac{p}{2} \right)' < p' \) we have \(- (n - \gamma)p' + \frac{n}{\sigma} p (\sigma - 1) < 0\).

Therefore it is enough to choose \( a_K = 2^{-K\varepsilon} \) with \( \varepsilon \) small enough and then \( u^\sigma \in D_{p',\gamma} \) with \( \alpha = \frac{\sigma - 1}{p' - 1} \).

This finishes the proof of (i).

The proof of the sufficiency of condition \( D_{p',\gamma}(d\mu) \) in (2.16) is obtained in a similar way using (3.18) (ii).

For the necessity observe that for any ball \( \hat{B} \)

\[
\hat{B} \subset \{(x,t) : \mathcal{M}_{\mu,\gamma} f(x,t) \geq |B|^\frac{1}{p} - 1 \int_{B} |f(y,u)| \, d\mu(y,u)\},
\]

then (2.15) for \( T = \mathcal{M}_{\mu,\gamma} \) implies that

\[
\int_{\hat{B}} u(x,t) \, d\mu(x,t) \leq C \left( \int_{\hat{B}} |f(y,u)| \, d\mu(y,u) \right)^{-p} |B|^{(\frac{1}{p} - 1)p} \int_{\mathbb{R}^{n+1}} |f(y,u)|^p v(y,u) \, d\mu(y,u),
\]

therefore for \( f = X_{\hat{B}} y^{1-p'} \) we get the result.

**Proof of Theorem (2.17):** Since \( T_{\mu,\gamma} \) is essentially self-adjoint, a simple duality argument shows that the pair \((u(x,t), v(x,t))\) satisfies (2.15) for the exponent \( p \) if and only if the pair \((v(x,t)^{1-p'}, u(x,t)^{1-p'})\) satisfies the same inequality with exponent \( p' \). Thus (i) is actually equivalent to (2.16) (i).

The necessity of (ii) is obtained as in (2.16) (ii).

For the sufficiency we consider the \( \ell^\infty \)-valued operator

\[
\widetilde{T}_{\mu,\gamma} f(x,t) = \{X_{Q_r}(x,t) \frac{1}{|Q_r|^{1-\gamma/n}} \int_{Q_r} f(y,u) \, d\mu(y,u) \}_{r \in \mathbb{R}},
\]

where \( Q_r \) is the cube centered at origin and with side length \( r \).

It is clear that \( \mathcal{M}_{\mu,\gamma} f(x,t) = \|T_{\mu,\gamma} f(x,t)\|_{\ell^\infty} \). Therefore a pair \((u(x,t), v(x,t))\) satisfies (2.15) for \( \mathcal{M}_{\mu,\gamma} \) if and only if satisfies (3.19)

\[
\int_{\mathbb{R}^{n+1}} \|\widetilde{T}_{\mu,\gamma} f(x,t)\|_{\ell^\infty}^p u(x,t) \, dv(x,t) \leq C \int_{\mathbb{R}^{n+1}} |f(x,t)|^p v(x,t) \, d\mu(x,t).
\]
On the other hand we consider the operator \( \tilde{S}_{\nu,r} \), acting on \( \ell^1 \)-valued functions \( g(x,t) = (g_r(x,t))_r \), defined by
\[
\tilde{S}_{\nu,r}g(x,t) = \tilde{S}_{\nu,r}((g_r)_r)(x,t) = \sum_r \left( \frac{1}{|Q_r|^{1-\gamma/n}} \int_{Q_r} g_r(y,u) d\mu(y,u) \right) \chi_{\tilde{Q}_r}(x,t).
\]

A simple duality argument shows that \((u(x,t), v(x,t))\) satisfies (3.19) if and only if \((v(x,t)^{-p'}, u(x,t)^{-p'})\) satisfies
\[
\int |\tilde{S}_{\nu,r}g(x,t)|^{p'} v(x,t)^{-p'} d\mu(x,t) \leq C \int \|g(x,t)\|_{p'}^{p'} u(x,t)^{-p'} d\nu(x,t).
\]

It is clear, see the proof of Proposition (3.11), that
\[
\tilde{S}_{\nu,r}g(x,t) = \tilde{S}_{\nu,r}((g_r)_r)(x,t) \leq \tilde{S}_{\nu,r}((A_r(|g_r|))_r)(x,t)
\]
where
\[
\tilde{S}_{\nu,r}((f_r)_r)(x,t) = \sum_r \left( \frac{1}{|Q_r|^{1-\gamma/n}} \int_{Q_r} f_r(y) dy \right) \chi_{\tilde{Q}_r}(x,t),
\]
but, since \(d\nu\) is a Carleson measure, \(\tilde{S}_{\nu,r}\) maps \(L^1_\nu(\ell^1)\) into weak-\(L^{n-\gamma}_\nu(d\mu)\), \(1 < p < \infty\); therefore by using (3.9) we conclude that \(\tilde{S}_{\nu,r}\) maps \(L^1_\nu(\ell^1)\) into weak-\(L^{n-\gamma}_\nu(d\mu)\). Moreover \(\tilde{S}_{\nu,r}\) has a \(\mathcal{L}(\ell^1, C) \approx \ell^\infty\)-valued kernel
\[
K(x,y,t,u) = \{ \frac{\chi_{\tilde{Q}_r}(x,t)}{|Q_r|^{1-\gamma/n}} \chi_{\tilde{Q}_r}(y,u) \},
\]
that satisfies
\[
\|K(x,y,t,u)\| \leq \frac{C}{(|x-y| + t + u)^n - \gamma}.
\]

With the last two ingredients and using the ideas in the proof of (3.18) (i), one can proof that
\[
(3.21) \text{If } u^{-p'} \in D_{p',\gamma}(d\nu) \text{ and } G = L^p_{d\nu}(\mathbb{R}^{n+1}, u^{-p'} d\nu) \text{ then}
\]
\[
\| (\sum_j |\tilde{S}_{\nu,r}g_j|^{p'})^{1/p'} \|_{L^p(S_k, d\nu)} \leq C \sum_j \|g_j\|_{C}^{p'}.
\]

Therefore we can apply Theorem (1.1) and conclude that there exists a weight \(u^{-p'}\), with \(u^{-p'}(1-p') \in D_{p',\gamma}(d\mu)\) and such that (3.20) holds.

Now the proof finishes by observing that \(u^{-p'} \in D_{p',\gamma}(d\nu)\) if and only if \(u \in Z_{p',\gamma}(d\nu)\).

Proof of the Theorem (2.24): It is known that a Banach space $E$ is U.M.D. if and only if $E^*$ is U.M.D., therefore, by duality, a pair satisfies (2.25) if and only if the pair $(v(x)^{1-p'}, u(x)^{1-p'})$ satisfies

$$
\int_{\mathbb{R}} \|Hf(x)\|_{E'}^p v(x)^{1-p'} \, dx \leq C \int_{\mathbb{R}} \|f(x)\|_{E'}^p u(x)^{1-p'} \, dx.
$$

Then (i) and (ii) are equivalent statements in Theorem (2.24) and we shall limit ourselves to prove (i).

Given a vector $e \in E$ and a function $\varphi \in L^p(dx)$, we consider the $E$-valued function $f(x) = \varphi(x)e$, then (2.25) implies that

$$
\|e\|_E \int_{\mathbb{R}} |H\varphi(x)|^p u(x) \, dx \leq C \|e\|_E \int_{\mathbb{R}} |\varphi(x)|^p u(x) \, dx,
$$

therefore the necessity of the condition $D_p$, follows from the known necessarily condition in order to have

$$
\int_{\mathbb{R}} |H\varphi(x)|^p u(x) \, dx \leq C \int_{\mathbb{R}} |\varphi(x)|^p u(x) \, dx
$$

see [C, J], [R de F, 1].

For the sufficiency we need the following

(3.22) Proposition. Let $v \in D_p, 1 < p < \infty$, and $0 < s < 1$.

Then for every $K = 0, 1, 2, \ldots$ we have

$$
\left\| \sum_{j} \|H_j \|_{E'}^{1/p} \|L^s(S_K) \|^{1/p} \left( \sum_{j} \|f_j\|_{L^p_v(u)} \right)^{1/p} \right\|
\leq C 2^{k/s} \left( \sum_{j} \|f_j\|_{L^p_v(u)} \right)^{1/p}
$$

where $S_0$ is the unit ball in $\mathbb{R}$ and each $S_K, K \geq 1$, is the spherical shell

$$
S_K = \{x : 2^{K-1} \leq |x| < 2^K \}.
$$

Proof. Given $K \geq 0$, we decompose each function as $f = f' + f''$, where $f' = f \chi_{B_K}, f'' = f - f'$ and $B_K = \{x : |x| < 2^{K+1}\}$.

If $x \in S_K$, we have

$$
\|Hf''(x)\|_E \leq \int_{|y| \geq 2^{2K+1} > 2|x|} \frac{1}{|x-y|} \|f(x)\|_{E'} \, dy
\leq C \int_{|y| \geq 2^{2K+1}} \|f(y)\|_{E'} |y|^{-1} \, dy
\leq C \|f\|_{L^p_v(u)},
$$
Thus, Minkowski's inequality gives

$$\sup_{x \in S_K} \sum_j \|H f_j''(x)\|_E \leq C \left( \sum_j \|f_j\|_{L_p^E(v)}^{1/p} \right)^{1/p}.$$ 

On the other hand it is well known, see [Bk], that if $E$ is U.M.D. then $H$ maps $L^p_E$ into weak-$L^1_E$ and also that if $E$ is U.M.D then $E^p$, $1 < p < \infty$, is U.M.D. Then by Cotlar's inequality, see [G, R de F, V.2.8], we have

$$\left( \sum_j \|H f_j''\|_{L^p_E}^{1/p} \right)^{1/p} \leq C |S_K|^{1/s-1} \|f_j\|_{L^p_E}^{1/p} \|L^1_E(x)\|_{L^p_E(v)}$$

$$\leq C |S_K|^{1/s} \left( \sum_j \|f_j\|_{L^p_E}^{1/p} \right)^{1/p} \|L^1_E(x)\|_{L^p_E(v)}$$

$$\leq C |S_K|^{1/s} \|f_j\|_{L^p_E(v)}^{1/p} \|L^1_E(x)\|_{L^p_E(v)}$$

$$= C 2^{K/s} \left( \sum_j \|f_j\|_{L^p_E(v)}^{1/p} \right)^{1/p}. \quad \blacksquare$$

Now we continue the proof of the sufficiency in Theorem (2.4). We apply Theorem (1.1) with $A_K = S_K, F = E, G = L^p_E(v)$ and we conclude that there exists $u$ satisfying (2.25). Moreover $u$ can be found such that

$$\left( \int_{S_K} u(x)^{1-\sigma} dx \right) \leq \left( a_K^{-1/2} 2^{K/2} \right)^{p(\sigma-1)},$$

with $\sigma = \left( \frac{p}{s} \right)'$ and $a_K$ such that $\sum a_K^2 < +\infty$, then

$$\int_{R^n} \frac{u(x)^{1-\sigma}}{(1 + |x|)^p} \leq \sum_{K=0}^{\infty} 2^{-Kp} \left( a_K^{-1/2} 2^{K/2} \right)^{p(\sigma-1)},$$

but as $\sigma = \left( \frac{p}{s} \right)' < p$ we have $-p' + \frac{p}{s}(\sigma - 1) < 0$, therefore if we choose $a_K = 2^{-K\epsilon}$ with $\epsilon$ small enough we obtain that $u^\alpha \in D_p$ for $\alpha = \frac{p-1}{\sigma-1}$.

**Proof of (2.26):** The necessity condition follows as in Theorem (2.24) since if we take $f(x) = \varphi(x) e, \varphi \in L^p(R^n)e \in E$, we have

$$\|e\|_E \int_{R^n} M \varphi(x) P u(x) dx \leq C \|e\|_E \int_{R^n} |\varphi(x)| P v(x) dx.$$
For the sufficiency we consider the $E(\ell^\infty)$-valued operator

$$\bar{T} f(x) = \left\{ \chi_{Q_r}(x) \frac{1}{|Q_r|} \int_{Q_r} f(y) \, dy \right\}_{r \in \mathbb{R}} ,$$

where $Q_r$ is the cube in $\mathbb{R}^n$ centered at origin and with side length $r$. It is clear that for positive $E$-valued functions we have

$$\| \bar{T} f(x) \|_E = \| \bar{T} f(x) \|_{E(\ell^\infty)} .$$

Therefore a pair $(u(x), v(x))$ satisfies (2.27) if and only if satisfies

$$(3.23) \quad \int_{\mathbb{R}^n} \| \bar{T} f(x) \|_{E(\ell^\infty)}^p u(x) \, dx \leq C \int_{\mathbb{R}^n} \| f(x) \|_{E(\ell^p)}^p v(x) \, dx .$$

Since $E$ is a U.M.D. Banach lattice, then $\ell^p(E), 1 < p < \infty$, is a U.M.D. Banach lattice then the operator $(f_j) \rightarrow (\bar{T} f_j)$ is bounded from $L^1_{\ell^p(E)}(\mathbb{R}^n)$ into weak-$L^1_{\ell^p(E)}(\mathbb{R}^n)$, and therefore the operator $(f_j) \rightarrow (\bar{T} f_j)$ is bounded from $L^1_{\ell^p(E)}(\mathbb{R}^n)$ into weak-$L^1_{\ell^p(E(\ell^\infty))}(\mathbb{R}^n)$.

Moreover $\bar{T}$ is an operator given by a $E(\ell^\infty) \subseteq L(E, E(\ell^\infty))$-valued kernel

$$\bar{K}(x, y) = \left\{ \chi_{Q_r}(x) \chi_{Q_r}(y) \right\}_{r \in \mathbb{R}} .$$

This kernel obviously satisfies

$$\| \bar{K}(x, y) \|_{\ell^\infty} \leq \frac{C}{|x - y|^n} .$$

With the last two observations it is easy to follow the patterns of the proof of Proposition (3.22) in order to prove

$$(3.24) \quad \text{Proposition. Let } \nu \in D_p, 1 < p < \infty, \text{ and } 0 < s < 01. \text{ Then for every } K = 0, 1, 2, \ldots \text{ we have}$$

$$\| \left( \sum_j \| \bar{T} f_j \|_{E(\ell^\infty)} \right)^{1/p} \|_{L^\infty(S_K)} \leq C 2^{K s} (\sum_j \| f_j \|_{L^p_\nu(v_j)})^{1/p}$$

where $S_0$ is the unit ball in $\mathbb{R}^n$ and each $S_K, K \geq 1$, is the spherical shell

$$S_K = \{ x \in \mathbb{R}^n : 2^{K-1} \leq |x| < 2^K \} .$$
Now we apply Theorem (1.1) with $A_K = S_K, F = E(\ell^\infty), G = L_p^\infty(v)$ and we conclude that there exists $u$ satisfying (3.23), hence (2.27) and such that

$$\int_{S_K} u(x)^{1-\sigma} dx \leq (a_K^{-1} a_K^p)^{p(\sigma-1)},$$

with $\sigma = (\frac{p}{q})'$ and $a_K$ such that $\sum_K a_K^p < +\infty$, then proceeding as usual we find $u^\alpha \in D_p$ for $\alpha = \frac{p'-1}{\sigma-1}$.

In order to prove the sufficient condition in part (ii) we consider the operator $\hat{S}$, acting on $E^*(\ell^1)$-valued functions, $g(x) = (g_r(x))_r$, defined by

$$\hat{S}g(x) = \sum_r \left( \frac{1}{|Q_r|} \int_{Q_r} g_r(y) dy \right) \chi_{Q_r}(x).$$

A simple duality argument shows that $(u, v)$ satisfies (3.23) if and only if $(v^{1-p'}, u^{1-p'})$ satisfies

$$(3.25) \int_{\mathbb{R}^n} \|\hat{S}g(x)\|_{E^*(\ell^1)}^{p'} u^{1-p'}(x) dx \leq C \int_{\mathbb{R}^n} \|g(x)\|_{E^*(\ell^1)}^{p'} u^{1-p'}(x) dx$$

but as $\ell^p'(E^*), 1 < p < \infty$, is a U.M.D. Banach lattice we have that the operator $(g_j)_j \to (\hat{S}g_j)_j$ is bounded from $L^1_{\ell^p'}(E^*(\ell^1))(\mathbb{R}^n)$ into weak-$L^1_{\ell^p'}(E^*)(\mathbb{R}^n)$. Moreover $\hat{S}$ has the $\ell^\infty \subseteq L(E^*(\ell^1), E^*)$-valued kernel

$$L(x, y) = \{ \frac{\chi_{Q_r}(x) \chi_{Q_r}(y)}{|Q_r|} \}_{r \in \mathbb{R}}$$

satisfying $\|L(x, y)\|_{E^*} \leq \frac{C}{|x - y|^{n}}$.

Then we can reproduce the arguments that we did above for $\tilde{T}$ and obtain that if $u^{1-p'} \in D_p$ then (3.25) holds for some $v^{(1-p')/p} \in D_{p'}$. Therefore by duality if $u \in Z_p$ then (2.23), and hence (2.27), holds for some $v^\alpha \in Z_p$. □
