ANALISI D'AGUNES ESCALES D'AUTOCONCEPTE I D'AUTOESTIMA

Fem referència, a continuació, a algunes de les escales més rellevants en els estudis realitzats sobre l'autoestima. Hem trobat que són moltes, però la nostra revisió ha tingut en compte el contingut dels ítems i l'àmbit d'aplicació. Aquest dos elements són els que hem considerat a l'hora de dissenyar el nostre propi instrument de mesura de l'autoestima i els que expliquen la reducció a cinc descripcions.

1.- Escala d'autestima de Rosenberg

Va ser elaborada per Rosenberg per a l'estudi que posteriorment seria publicat sota el títol **Society and the adolescent self-image** (Rosenberg, 1965) posteriorment traduït al castellà (Rosenberg, 1973).

És una escala de valoració que pretén aconseguir un índex unidimensional de l'autoestima global. De fet és una escala d'autopercepció.

A nosaltres ens ha servit per a la redacció d'alguns ítems d'autoestima general però la nostra escala, per coherència amb el marc teòric, en el que defensem la pluridimensionalitat de l'autoconcepte, ha estat complementada amb altres ítems.

L' escala de Rosenberg va aconseguir un coeficient de fiabilitat de 0.85 amb el procediment test-retest en un interval de 15 dies.

2.- Escala d'autoconcepte de Tennessee

El seu autor és W.H. Fitts (1964) i és considerada com una de les millors escales, àmpliament aplicada en molts estudis i com a base d'altres escales.

És molt llarga (100 ítems) i va ser elaborada per a descriure l'autoconcepte multidimensional amb aplicacions a l'orientació psicològica i a la investigació clínica.

A més del nivell d'autoestima general abarca totes les

dimensions en les que es pot moure una persona: identitat, autosatisfacció, comportament, autoconcepte físic, autoconcepte ètic-moral, autoconcepte personal, autoconcepte familiar, autoconcepte social. En total 90 ítems. Els deu restants són d'autocrítica.

La fiabilitat obtinguda va ser de 0.88, puntuació aconseguida reiteradament (amb poques diferències) en diverses aplicacions. Els ítems van ser inclosos a l'escala després d'haver aconseguit la classificació per unanimitat dels jutges.

3.- Escala d'autoestima de Coopersmith

Coopersmith (1967) publicà la seva escala composta per 58 ítems davant dels quals el subjecte es posiciona segons que l'ítem descrigui com se sent normalment la persona o, per contra, descrigui una cosa diferent al que sent. ("M'agradaria ser una altra persona". "Em sento bastant segur de mi mateix")

La fiabilitat aconseguida pel procediment de test-retest va ser de 0.88.

Aquesta escala es pot dividir en quatre subescalas: la social, els companys, els pares i l'acadèmica.

4.- Escala "Intellectual achievement responsibility" (I.A.R.)

Crandall (1965) i els seus collaboradors van posar a punt aquesta escala per avaluar els processos d'atribució de causes dels èxits i dels fracassos en situacions estrictament intel·lectuals. Consta de 34 ítems presentats per parelles. El subjecte es veu forçat a escollir una de les dues situacions -una externa i l'altra interna- amb igual nombre d'ítems positius que negatius.

Com en altres escales d'aquest tipus, la IAR s'inspira en la definició de LOC de Rotter (1966) i ofereix, a més, tres puntuacions: internalitat positiva, internalitat negativa i internalitat total.

L'objectiu de Crandall i dels seus col.laboradors era, segons Rodriguez i altres (1992) d'esbrinar quines variables podrien resultar útils

per tal de predir el comportament diferencial dels subjectes en situació d'èxit, ja que, en aquests casos les dificultats per obtenir un èxit estimulen alguns nens a esforçar-se més i a uns altres a bandonar l'esforç. Suposen els autors que les causes de l'esforç per arribar a una fita s'ubiquen, sobretot, en les expectatives de control intern.

Les particularitats de l'escala de Crandall són: a) les situacions estan enfocades exclusivament a l'àmbit intel·lectual-acadèmic. b) les forces ambientals externes són les persones més properes als nens (pare, mestres, companys...) c) diferència entre resultats positius i negatius.

El coeficient de consistència interna de l'escala I.A.R. aconseguit en diversos estudis està en torn a 0.60 segons Rodriguez-Naranjo i altres (1992) i de 0.67, segons M. Claes (1981)

5.- Escalas de Lugar de Control en situaciones académicas (ELC-A) y en situaciones interpersonales (ELC-I) para niños y adolescentes.

Ès un dels instruments d'avaluació de les expectatives de lloc de control creat per autors del nostre medi. Els professors Godoy, Rodríguez-Naranjo i Esteve (1989) van elaborar aquestes escales per tal d'avaluar les dimensions d'internalitat-externalitat i controlabilitat-incontrolabilitat tant en situacions acadèmiques com interpersonals, avaluant resultats positius i negatius.

Les escales consten de 34 i 32 ítems respectivament i cada ítem està format per una afirmació i quatre opcions de resposta de menys a més internalitat o de menys a més controlabilitat.

Els coeficients de fiabilitat, segons els propis autors (Rodriguez-Naranjo i altres, 1992) fluctuen en ambdues escales entre 0.70 i 0.85, la qual cosa es pot considerar una valoració adequada.

La literatura al voltant de l'atribució de la causalitat i del lloc de control ofereix una extensa i variada mostra d'instruments d'avaluació. Nosaltres ens hem limitat a fer una breu referència d'aquells que més ens han servit per elaborar les nostres pròpies escales.

ESCALA DE FACILITAT-DIFICULTAT DE LES CARRERES UNIVERSITARIES

Per tal de poder contrastar el GRAU DE DIFICULTAT subjectiva que els estudiants de COU manifesten sobre els diversos estudis universitaris, em proposo, ara, conèixer el punt de vista que els professionals i els professors tenen sobre aquest particular.

Per això li demano que contesti aquest qüestionari marcant el número que correspongui a la seva opinió segons aquesta clau:

- 0.- Crec que és una de les carreres més fàcils.
- 1.- Carrera més aviat fàcil.
- 2.- Dificultat normal.
- 3.- La considero bastant difícil.
- 4.- Crec que és de les més difícils

QÜESTIONARI A.G.A.P.

(VERSIO DEFINITIVA)

PRESENTACIO:

El QÜESTIONARI A.G.A.P. és, de fet, un conjunt de Qüestionaris. Amb ells es pretén recollir informacions diverses sobre les actituds dels estudiants de COU envers ells mateixos i envers la seva feina; què pensen d'ells mateixos i dels seus estudis; com els agradaria ser com a persones i com a estudiants i quines aspiracions acadèmiques i laborals tenen.

Totes aquestes informacions, que són la base d'un treball investigació, han de servir, també, per la millora de l'educació en general i per l'orientació escolar, personal i professional, en particular.

Es pot contestar d'una manera força àgil ja que la forma de manifestar les pròpies opinions és posant un **X** al número o al **O** que correspongui. Requereix, però, posar-hi el màxim d'atenció ja que hi ha moltes expressions aparentment semblants.

El Qüestionari és anònim i la informació que se'n tregui és confidencial. Per això estic convençut que les teves respuestes seran absolutament sinceres. Pensa que no hi ha respuestes encertades i respuestes errònies. Totes són bones sempre i quan reflecteixin els teus pensaments i els teus sentiments.

**T'AGRAEIXO DES D'ARA QUE HO VULGUIS FER AIXI
DE BE !!**
